REPORT

OF THE

COMMISSIONER OF PATENTS

FOR THE YEAR 1860.

ARTS AND MANUFACTURES.

VOLUME I.

WASHINGTON:
GEORGE W. BOWMAN, PRINTER.
1861.

IN THE SENATE OF THE UNITED STATES,

February 5, 1861.

Resolved, That fifteen thousand additional copies of the Annual Report of the Commissioner of Patents on arts and manufactures for the year 1860, be printed for the use of the Senate, and ten thousand copies for the Interior Department for purposes of official distribution: *Provided*, That the tabular statements and indices be printed with nonpareil type and the description of patents with brevier type, so as to complete the entire report in two octavo volumes.

ASBURY DICKINS, *Secretary*.

INDEX.
REPORT
COMMISSIONER OF PATENTS
UNITED STATES PATENT OFFICE,
January 29, 1861.

SIR: I have the honor herewith to transmit the Annual Report of this office for the year 1860, to be laid before Congress.

I am, very respectfully, your obedient servant,

S. T. SHUGERT,
Acting Com. Patents.

Hon. JOHN C. BRECKINRIDGE,
Vice President United States.

INDEX.

NOTE.—The claims are arranged in strictly numerical order, and the engravings in nearly the same order.

Invention or Discovery.	Name of Patentee.	Number.

Beehives	S. Maitland	29,799
Beehives	C. Williams	29,848
Beehives	J. Jacobs	30,143
Beehives	S. R. Bryant	30,202

Invention or Discovery.	Name of Patentee.	Number.
Beehives.....	H. M. Shaffer	30,254
Beehives.....	J. W. Palmer and J. K. Leedy.....	30,341
Beehives.....	J. C. Pratt	30,984
Beer, Factitious.....	F. Luedke	30,147
Beer Measures.....	E. Bagot.....	26,807
Beer Powders.....	J. McKellar	28,289
Bellows.....	J. B. and J. A. Maxwell	27,062
Bellows, Forge	W. Thompson	27,936
Bell Attachments.....	A. E. Taylor.....	30,509
Bell Pulls.....	C. J. Bradbury	27,330
Bells, Dumb.....	D. F. Savage.....	28,505
Bells, hanging.....	T. H. Bell	27,880
Bells, hanging.....	G. R. Meneely.....	30,338
Bells, ringing.....	B. Kilt.....	28,586
Bells, ringing, Apparatus for	J. Harrison.....	29,784
Belts, Lacings for.....	H. A. Alden.....	29,348
Belts, Pulley, measuring strain on, machine for.....	J. B. Duff and T. W. Keating.....	28,743
Belt Fastenings.....	G. W. Blake	28,033
Belt Punches.....	C. D. Wheeler	26,940
Belt Skippers.....	J. C. Goar.....	29,587
Belting.....	H. Underwood	27,846
Belting, Elastic.....	D. C. Gately	27,440
Belting, Elastic.....	J. and S. Peatfield.....	27,471
Belting, India Rubber, Manufacture of.....	D. C. Gately	26,669
Belting, Rubber, making.....	T. J. Mayall.....	27,001
Belting, Rubber, making	T. J. Mayall.....	27,730
Belting, Rubber, Manufactures of.....	D. C. Gately	26,982
Belting Machines.....	T. J. Mayall.....	27,060
Berths, Ships', Oscillating.....	T. S. Brown	29,763
Biers.....	W. Scarlett	30,251
Billiard Cues, attaching leathers to.....	W. L. Aldrick.....	27,093
Bills of Fare.....	W. A. Bury.....	28,152
Bills of Fare, Frames for.....	C. Gloyd.....	30,311
Binding Engravings, &c.....	W. T. Anderson.....	30,277
Bits, Plane, securing.	T. M. Richardson.....	30,248
Bits, Stock.....	W. Lyon.....	30,487
Black Boards, Composition for Covering.....	J. B. Rowell	29,552
Blinds, Window, for making.....	C. W. Smith.....	28,908
Blinds, Window, operating the Slats of.....	J. D. Burdick.....	27,520
Blind Fasteners.....	W. S. Kirkham	30,581
Blind Fasteners, Window.....	A. T. Finch.....	30,397
Blind Fastenings.....	J. J. Henry.....	30,730
Blind Operators.....	L. N. Fay and W. Mason.....	27,119
Blind Operators.....	J. Johnson	27,295
Blind Rods, wiring.....	J. Coover	29,467
Blind Slats, Machines for making.....	S. Jackson.....	28,809
Blind Slats, Machines for making	H. B. Smith.....	30,429
Blind Slats, Machines for making Window	H. W. Farmer.....	27,976
Blocks, Ships', stretching Straps of.....	E. Mack	30,535
Blowers.....	T. C. Richards.....	26,863
Blowers.....	R. Lapham.....	28,758
Blowers.....	P. H. Roots	30,157
Blowers, Fan.....	H. Sweetapples.	29,417
Blow Pipe operations, Composition for Supports in.....	J. B. Hyde	30,680
Boards, Machine for Thinning.....	S. Case	29,861
Boats.....	P. Davis	26,657
Boats convertible into land carriages.....	P. Davis	30,618
Boats, Life.....	S. Mills.....	29,508
Boats, Life, Surf.....	J. R. Grace.....	27,362
Boats, lowering, apparatus for.....	W. Flowers and Z. S. Patton	29,264
Boats, Ships', attaching and detaching.....	R. S. Stubbs.....	30,698
Boats, Ships', lowering and detaching	J. A. Davis.....	29,064
Boats, suspending	C. H. Hasker.....	28,478
Boilers	C. Godfrey	30,917
Boilers for cooking stoves	A. S. Sterling	28,789
Boilers for hot water, Apparatus in	E. B. Cherevoy	27,858
Boilers for heating buildings.....	C. F. Hitchings.....	28,272
Boilers for preparing paper stuff	C. S. Buchanan	28,062
Boilers, Locomotive	J. Thompson	28,520
Boilers, Steam.....	B. F. Campbell	30,957
Boilers, Steam.....	S. Solliday	30,992
Boiler Feeders for Steam Engines.....	E. A. Woods	29,028
Boiler Plates, rivetting.....	J. B. Henry	26,846
Boiling and Condensing Apparatus.....	G. S. G. Spence	29,414
Boiling and Distilling, Apparatus for.....	W. Hoffmire	29,376
Bolsters, Swinging, for car trucks.....	M. C. Andrews.....	28,545
Bolting Chests.....	M. C. Coggsell and J. McKiernon.	28,654
Bolting Flour.....	W. Halderman	29,483
Bolts, Door.....	N. W. Bonney	28,827
Bolts for door locks	E. Parker	27,064
Bolts, Flush.....	W. R. Carnes	28,346
Bolts, Heading	H. Abbott	27,943
Bolts, Shutter.....	A. Reeve.....	30,091

Invention or Discovery.	Name of Patentee.	Number.
Bolts for store shutters	W. C. Fisher.	28,844
Bomb Shells.....	W. Rice.....	29,995
Bone Black, Apparatus for revivifying	W. Mitchell.....	27,462
Bone Black, Apparatus for washing	C. Kinzler.....	29,128
Bonnet Frames, manufacture of.....	R. T. Wilde	28,028
Bonnet Fronts, Frames for	G. A. Cox.....	26,836
Bonnets	A. Henri	28,082
Books, binding	T. Towndrow.....	28,521
Book and Paper Trimming Machines	G. Utley.....	29,532
Boom Jaws, Elastic Lining for.....	O. P. Rowland	28,608
Boots, Congress.....	H. S. Holmes.....	28,754
Boots, crimping, Machines for.....	J. S. Nolen and C. C. Hinckman	27,561
Boots, crimping, Machines for.....	R. Warren	27,586
Boots, crimping, Machines for.....	P. Shaw.....	30,502
Boots, Gaiter	C. K. Bradford.....	30,097
Boots, Tools for trimming.....	L. C. Rogers.....	30,427
Boots, Vamps of, cutting	E. L. Vertrees.....	27,173
Boots, Shoes, and Overshoes.....	W. S. McEwen.....	27,918
Boots and Shoes	N. C. Lewis, jr.....	29,344
Boots and Shoes	L. R. Blake	29,562
Boots and Shoes	J. M. Allen.....	30,034
Boots and Shoes	S. F. Dexter.....	30,391
Boots and Shoes	H. Port and E. Surgi.....	30,419
Boots and Shoes, Cleaning Apparatus for.....	J. Chesley.....	28,736
Boots and Shoes, Hand Machines for pegging	F. J. Vittum.....	30,846
Boots and Shoes, Jointed Tips for	G. A. Mitchell.....	28,395
Boots and Shoes, Manufacture of.....	F. D. Ballou.....	26,808
Boots and Shoes, Manufacture of.....	L. R. Blake.....	29,561
Boots and Shoes, skiving counters, Machines for	W. A. Bacon.....	28,531
Boot and Shoe Wipers.....	J. K. Stamun	28,614
Boot-jacks.....	G. Wheeler	28,927
Boring Artesian Wells, Apparatus for.....	J. Taney	27,935
Boring Brush Hooks.....	T. Mitchell.....	26,778
Boring or Mortising Machines, Feed Motion for	J. M. Kendall	27,134
Boring Wells, Implements for	J. M. Butler.....	27,268
Bosom Expanders.....	D. M. Church and C. H. Ellsworth	28,155
Bosom Expanders, Shirt.....	S. J. Shaw	30,842
Bottles	J. N. Bordine.....	29,563
Bottles	J. Maurer.....	29,611
Bottles, Apparatus for filling.....	C. A. Gregory.....	29,781
Bottles, Faucets for	J. Hiney.....	30,920
Bottles, forming screws in necks of, Tools for.....	J. Focer.....	30,106
Bottles, Glass, Tools for forming necks and orifices of.....	R. MacLardy.....	27,333
Bottles for indellible ink, Cases for.....	E. Daniels.....	29,469
Bowls, Wooden, making	R. Simonds and G. N. Goodspeed.....	29,411
Boxes, Ballot.....	G. L. Bailey.....	28,339
Boxes, Ballot, Apparatus for detecting fraud in.....	M. I. Shinn.....	30,503
Boxes, Bonnet.....	C. A. Taylor	28,916
Boxes for carriage wheels	W. Sharp.....	27,314
Boxes, Crank.....	G. Westinghouse	27,588
Boxes, Core	J. S. Harper	28,574
Boxes, Cutting	C. Sewerkrop	29,524
Boxes, Drop Letter	J. North.....	27,466
Boxes for dropping sugar	A. T. Ballantine.....	30,516
Boxes, Game	S. F. Brooks.....	28,733
Boxes, jointing	W. Duryea.....	29,959
Boxes, Letter.....	G. C. Jenks	30,324
Boxes, Mitre	H. B. Nash	30,027
Boxes, Porter Bottle.....	G. W. Righter	28,606
Boxes, Spelling.....	D. F. Dunham.....	30,622
Boxes, Steam Stuffing, for revolving rolls	H. Campbell.....	28,648
Boxes, Tin, making.....	C. J. Haywood	28,634
Boxes, Tobacco	A. Friedrich and C. Walter	29,152
Boxes, Tobacco	H. Kurth, F. Dahis, and C. Rabitaille.....	29,387
Boxes, Wooden, Machines for finishing.....	H. A. Jones	28,038
Box Rollers for printers	H. J. Spiller	28,514
Bracelet Fastenings.....	J. Bissinger.....	27,264
Bracelets, manufacture of	G. Sanford	30,250
Braces for harness breeching, and breast plates.....	E. Bricket.....	27,098
Braces, self-adjusting, for jack screws or other hoisting apparatus.....	E. W. Cady	29,951
Braces, Spiral	L. B. Wright	30,601
Brackets, curtain cords.....	T. S. Pye.....	30,985
Brackets for railroad car trucks.....	T. F. Allen	27,608
Braiding Machines.....	E. B. Day	27,039
Brakes, Car	E. F. Jewett.....	28,087
Brakes, Car	H. A. Mears.....	28,098
Brakes, Car	H. W. Norvill.....	29,712
Brakes, Car	P. Keffer.....	30,946
Brakes, Carriage.....	E. Behr.....	29,453
Brakes, Carriage, Self-acting.....	A. Larowe	27,639
Brakes in city railroad cars.....	R. W. Jenks, jr., and F. A. Steere.....	27,910
Brakes, Friction, for bobbins	T. Estes.....	30,725

Invention or Discovery.	Name of Patentee.	Number.
Brakes, Hemp.....	J. Mills, Jr.....	28,497
Brakes, Hemp.....	E. M. Lacy.....	29,388
Brakes, Hemp.....	R. J. Gatling.....	29,875
Brakes, Hemp.....	I. Scoville.....	30,161
Brakes, Hemp.....	E. Guile.....	30,402
Brakes, Horse-power.....	T. Harvey and N. J. Beecker.....	29,280
Brakes, Railroad.....	C. R. Davidson.....	27,038
Brakes, Railroad.....	N. Hodge.....	28,670
Brakes, Railroad.....	J. H. Steiner.....	28,817
Brakes, Railroad.....	C. F. Langford.....	28,990
Brakes, Railroad Car.....	M. Obermiller.....	26,702
Brakes, Railroad Car.....	A. Bean.....	27,344
Brakes, Railroad Car.....	E. B. Turner.....	27,486
Brakes, Railroad Car.....	W. Somerville, Jr.....	29,725
Brakes, Railroad Car.....	R. W. Hix.....	30,921
Brakes, Self-acting, disengagement of.....	W. A. Gibson.....	27,045
Brakes, Sleigh, Self-acting.....	J. Dutcher.....	29,251
Brakes, Wagon.....	J. H. H. Bennett.....	29,232
Brakes, Wagon, Self-acting.....	J. Dutcher.....	26,896
Brakes, Wagon, Self-acting.....	G. W. Morgan.....	27,558
Brakes, Wagon, Self-acting.....	W. May.....	28,636
Brakes, Wagon, Self-acting.....	H. W. Norville.....	29,299
Brakes, Wagon, Self-acting.....	G. Buchanan.....	29,764
Bread, Manufacture of.....	B. Garvey.....	29,158
Bread Slicers.....	H. F. Bond.....	27,199
Bread Slicers.....	J. Stilley.....	27,315
Bread Slicers.....	L. W. Baker.....	29,558
Bricks, Fire.....	E. Seavey.....	28,692
Brick Machines.....	L. Kirk.....	26,997
Brick Machines.....	I. M. Gattman.....	29,036
Brick Machines.....	J. Hotchkiss.....	29,171
Brick Machines.....	W. Wood.....	29,645
Brick Machines.....	W. S. Wallace.....	29,834
Brick Machines.....	J. Parsons.....	30,541
Bridges, Automatic Draw, for Canals.....	G. C. Bovey.....	28,148
Bridges, Draw, Self-acting.....	L. Scheider and J. A. Montgomery.....	29,917
Bridges, Floating.....	T. Schofield.....	27,571
Bridges, Iron.....	J. P. Fisher.....	28,845
Bridges, Truss.....	G. O. Bishop.....	27,963
Bridges, Truss.....	J. L. Jones.....	30,577
Bridges, Truss, frame for.....	E. Jacobs.....	26,680
Bridges, Truss, Plates for securing the chords, braces, &c., of.....	F. C. Lowthrop.....	27,457
Bridle Bits.....	W. F. McWilliams.....	26,804
Bridle Bits.....	H. Crane.....	28,563
Bridle Bits.....	W. F. and W. R. Johnson.....	29,284
Bridle Bits, attachment for.....	J. D. Tracey.....	30,510
Bridle Reins.....	W. O. Williams.....	27,492
Brushes.....	W. Tusch.....	28,422
Brushes, Fly or Fan.....	M. Laveen.....	27,814
Brushes, Hair.....	J. R. Ingersoll.....	28,375
Brushes, Hair, Blocks for Shaping.....	A. G. Mitchell.....	27,005
Brushes, Machines for Making.....	J. Ruegg.....	30,353
Brushes, Machines for Making.....	J. Ruegg.....	30,693
Brushes, Nail.....	W. Thomson.....	29,419
Brushes, Tooth.....	H. N. Wadsworth.....	28,794
Brooms.....	T. Langdon and C. Weitman.....	29,179
Brooms.....	W. H. Towers.....	29,926
Brooms or Brushes.....	J. H. Power.....	29,099
Brooms, Metal Heads for.....	H. G. Smith.....	27,746
Buckets, Collapsible.....	C. W. Curtis.....	30,465
Buckets for Removing Coal, &c.....	J. S. Lloyd.....	27,993
Buckets, Well.....	D. P. Farnham.....	27,708
Buckles.....	J. C. Hall.....	27,714
Buckles.....	S. S. Hartshorn.....	29,270
Buckles.....	J. Tiebout.....	29,332
Buckles, Hame Tugs and.....	J. S. Topham.....	28,700
Buckles, Harness.....	J. U. Covel.....	29,361
Buckwheat, &c., Machine for Cleaning.....	J. H. Reed.....	29,940
Buildings, Machine for Moving.....	S. Wells.....	28,445
Buildings, Ventilating.....	S. M. Stone.....	30,938
Bundling kindling wood, Machines for.....	W. S. Williams.....	30,790
Bureaus.....	J. H. Better.....	26,881
Burners, Gas.....	G. W. Thompson.....	28,113
Burners, Gas.....	S. E. Woodworth and J. S. Wethered.....	28,708
Burners, Gas.....	W. Wright.....	28,709
Burners, Gas.....	J. McGlensey.....	28,761
Burners, Gas.....	A. G. Hamaker.....	29,486
Burners, Gas.....	H. H. Dodge.....	30,470
Burners, Gas, regulators for.....	W. Mallerd.....	30,917
Burners, Hydro carbon.....	M. L. Callender.....	30,703
Burners, Vapor.....	E. H. Anderson.....	27,676
Burners, Vapor.....	L. B. Hopkins and E. H. Anderson.....	27,718

Invention or Discovery.	Name of Patentee.	Number.
Burners, Vapor	O. F. Morrill	27,732
Burners, Vapor	W. N. Browne	28,250
Burners, Vapor	H. Johnson	30,578
Burners for vapor lamps	T. Connelly	26,888
Burners for vapor lamps	A. Geiger	26,983
Burners for vapor lamps	H. W. Dopp and W. S. Mead	27,211
Burners for vapor lamps	J. L. Butler, W. S. Horsford, and D. W. Smith	27,346
Burners for vapor lamps	E. Trittin	28,333
Burnishing Machines	A. M. White	30,707
Butts, Post	J. Holland	28,275
Butter, Printing	J. S. Miller and S. L. Megand	28,394
Butter Workers	L. W. Stiles	28,312
Butter Workers	W. H. Wiley	28,706
Butter Workers	C. A. Boynton	29,135
Butter Workers	L. S. Ingraham	29,492
Buttons	G. A. Meacham	26,776
Buttons	S. Krom	28,587
Button Holes, Apparatus for cutting	F. S. Leyboldt	30,925
C.		
Cables, Chain, Elastic or surge springs for ship's	A. H. Wright	27,505
Cables, Surge, reliever for	J. Bingham	29,338
Calculi, Apparatus for removing	W. A. Dudley	30,471
Calendars, Counting-house	J. Bryner	27,267
Calendars, Pocket	H. C. Foote	29,156
Calipers	C. D. Sutton	26,716
Calligraphs	C. Thurber	30,777
Cameras, Photographic	A. Semmendinger	27,241
Cameras, Photographic	E. M. Corbett	28,739
Cameras, Photographic	A. Semmendinger	29,523
Cameras, Photographic	S. Wing	30,850
Canal and river locks	J. Davis	30,564
Candles, Composition for coating	C. Morfit	26,780
Candles, Machines for making	M. Massey	27,995
Candles, manufacture of	H. Haverson	26,763
Candles, Moulding Apparatus for	G. A. Stanley	28,209
Candles, Mould Boxes for	G. A. Stanley	28,210
Candles, moulding	G. A. Stanley	26,797
Candles, moulding	G. A. Stanley	26,798
Candles, moulding	G. A. Stanley	29,416
Candles, moulding	F. Meyrose	29,506
Candles, moulding	A. Meucci	30,180
Candles, moulding	T. King	30,605
Candles, Moulding Machines for	W. Thomas	27,763
Candlesticks	H. E. Rogers	29,314
Candle Wicks	J. H. Tatum	29,729
Canes for physicians	S. T. Trowbridge	26,721
Canes and Seats, combination of	A. Crow	28,160
Cane Coverers	J. Allison	27,339
Cane Coverers	E. H. Angamar	29,842
Cane Juices, Applying Sulphurous Acids to	T. Byrne	29,860
Cane Juices, clarifying	P. Marceline and E. Eude	28,380
Cane Juices, Defecating Apparatus for	E. H. Wheeler	28,225
Cane Juices, desiccating	D. F. Boyd	27,033
Cane Juices, evaporation of	R. Wright	30,401
See also Saccharine Juices.		
Cannons, Toy	J. O. Conch	28,066
Cans, Exhausting and Sealing, Air-pumps for	W. Y. Gill	29,582
Cans, &c., forming grooves in the necks of	J. D. Willoughby	29,739
Cans, Fruit, sealing	J. M. Cooper and W. C. Haller	29,544
Cans, Oil	W. C. Arther	27,869
Cans, Oil	J. Jackson, Jr.	29,377
Cans, Paint	G. M. Bligh	27,265
Cans, Paint	J. W. Masury	29,090
Cans, Paint	E. A. Leland	29,651
Cans, Paint	W. L. Gilroy	30,310
Cans, Preserve	W. H. Harn	28,366
Cans, Preserve	T. Sellers	28,413
Cans, Preserve	A. T. Twing, E. Wood, and W. Elderhorst	28,424
Cans, Preserve, sealing	W. W. Paddock	30,585
Cans, Preserve, Stoppers for	Wm. T. Patton	26,820
Cans, Sealing, Apparatus for	H. Y. Wilders	30,440
Cans, Tin, wiring	T. Evans	30,860
Caoutchouc and Allied Gums, Rollers for making	T. Sault	27,160
Caoutchouc, Composition formed of	A. Wilmann	27,251
Caoutchouc, mode of holding Sockets during vulcanization of	F. D. Hayward	30,787
Caoutchouc, vulcanizing	A. K. Eaton	27,706
Caoutchouc, vulcanizing	C. T. Harris	27,798
Caoutchouc, vulcanizing	S. W. Warren	28,428
Caoutchouc, vulcanizing	O. Falke and A. C. Richard	30,807

Invention or Discovery.	Name of Patentee.	Number.
Caps, Felt, seamless forms for forming	J. L. Bridge and W. B. Lodge.....	28, 149
Caps, Fronts of, binding.....	L. Londinsky.....	28, 878
Caps, Metal, making, for boxes.....	C. Diedrich and W. T. Slocum.....	27, 756
Caps, Military.....	J. S. Smith.....	29, 724
Caps, &c., Sheet Metal, making.....	O. Newton.....	28, 397
Capstans, Portable, for mole ploughs.....	A. Little and others.....	30, 015

Cars, Railroad	S. J. Seeley.....	30, 041
Cars, Railroad, Apparatus for heating.....	J. Pine.....	30, 347
Cars, Railroad, Apparatus for ventilating and warming.....	J. J. Watson, W. Hardiker, and T. Toye..	30, 996
Cars, Railroad, Bearings for	D. R. Pratt.....	30, 547
Cars, Railroad Cattle	J. B. Shafer.....	29, 409
Cars, Railroad, dumping.....	A. B. Cooley.....	28, 969
Cars, Railroad, framing of.....	T. M. Mullen.....	27, 734
Cars, Railroad, Heaters for	W. Pauli.....	30, 753
Cars, Railroad, Metallic.....	J. A. Roebling.....	30, 426
Cars, Railroad, propelling	J. Busser and J. B. Harmer.....	28, 153
Cars, Railroad, propelling	J. A. Bennet.....	30, 287
Cars, Railroad, Running Gear for	R. Hornbrooke.....	27, 982
Cars, Railroad, stopping and starting.....	F. C. Kutt.....	29, 700
Cars, Railroad, transferring from one Track to another.....	J. Ashenfelder.....	30, 284
Cars, Railroad, ventilation of.....	E. B. Forbush.....	27, 212
Cars, Railway, for passengers.....	T. Castor.....	27, 203
Cars, Sleeping	J. B. Sutherland.....	29, 635
Cars, transferring from one Track to another	W. Wharton, Jr.....	30, 100
Cars for transporting Cattle, &c.....	L. Swearingen.....	28, 517
Car Bodies with Trucks, connecting.....	C. S. Moore.....	28, 095
Car Frames, Railroad, with metallic joints	T. L. Nichols.....	30, 833
Car Trucks, Brackets for Railroad.....	T. T. Allen.....	27, 608
Car Trucks, Railroad, swinging bolsters for	M. C. Andrews.....	28, 545
Cartridges	B. B. Hotchkiss.....	29, 080
Cartridges, Cases for.....	G. P. Foster.....	27, 791
Cartridges, Cases for.....	J. P. Lindsay.....	29, 287
Cartridges, Cases for, forming	C. Sharps.....	30, 647
Cartridges, Cases for Percussion, Machines for making.....	E. Allen.....	27, 094
Cartridges for fire-arms.....	J. W. Cochran.....	27, 428
Cartridges, Metallic.....	E. Allen.....	30, 109
Cartridges, Metallic, filling	H. Smith and D. B. Wesson.....	27, 933
Cartridges, packing	C. Sharps.....	29, 108
Carts, Coal	R. Heckscher.....	27, 049
Carts, weighing.....	G. M. Barth.....	27, 184
Casks, Metallic	W. B. Sealife.....	28, 014
Casters, Chair	T. Fay.....	27, 792
Casters, Furniture	J. A. Stafford.....	30, 505
Catamenial Bandages	F. Dashis and F. Doermer.....	29, 362
Cattle Breachy, Apparatus for.....	J. P. Ledy and W. Boyers.....	28, 286
Cements	H. Billings.....	28, 055
Cements	C. Fricke.....	28, 070
Cements	C. W. Fricke.....	28, 464
Cements	P. A. Letourneur.....	29, 979
Cements for roofing	J. F. Hammond.....	30, 919

Invention or Discovery.	Name of Patentee.	Number.
Cements, Silicated.....	G. E. Vanderburgh.....	28,541
Centre Boards for vessels.....	D. C. Gerard.....	28,979
Chains.....	P. D. Cummings.....	28,630
Chains.....	J. Blocher.....	30,797
Chains, Elastic or Surge Spring, for ships' cables.....	A. H. Wright.....	27,505
Chains, Gold, making.....	I. Lindsley.....	29,503
Chains, Link.....	G. W. N. Yost.....	30,019
Chains, Link.....	J. P. Kirk.....	30,632
Chains, Pattern for Loom.....	B. H. Jenks.....	29,283
Chains from sheet metal, making.....	L. Towne.....	26,801
Chains for timber-bending machines.....	L. Heywood.....	27,447
Chains, Watch.....	C. B. Carpenter.....	28,735
Chair Bottoms, Metallic.....	V. Stockton.....	29,553
Chair and Crib combined.....	S. Ray and M. R. Shatters.....	27,069
Chairs, Dental.....	V. Van Vleck.....	30,706
Chairs, Dental, construction of.....	J. Ask.....	29,936
Chairs, Folding.....	H. J. Pratt.....	30,858
Chairs, Folding.....	J. H. Swan.....	29,750
Chairs for invalids.....	C. Messenger.....	30,149

Clocks, Calendar	E. M. and J. E. Mix	27,023
Clocks, Calendar	E. Prichard	28,603
Clocks, Calendar	T. T. Strode	30,166
Clocks, Pendulum	G. M. Phelps	29,097
Clock Weights	B. F. Bond	27,684
Cloth, Dish, Holders	W. J. Johnson	27,225
Cloth, Drying, Machinery for	B. Sexton	28,202
Cloth, Elastic, Manufacture of	H. H. Day	28,456
Cloth, Marking, in Sewing machines, Mechanism for ..	H. W. Fuller	28,633
Cloth, Stretching, Machines for	E. C. Cleveland	30,801
Clothes Dryers	B. B. Hawse	26,674
Clothes Dryers	R. Merrill	27,231
Clothes Dryers	J. Johnson	29,599
Clothes Dryers	D. K. Hickok	29,694
Clothes Dryers	R. Gilbert	29,779
Clothes Dryers	H. E. Fickett	29,870
Clothes Dryers	O. P. Allen	29,943
Clothes Dryers	C. Robinson	30,249
Clothes Dryers	E. Dickerman	30,530
Clothes Dryers	J. Johnson	30,551
Clothes Dryers	H. C. Boardman	30,868
Clothes Frames	T. S. Scoville	26,710
Clothes Frames	J. Frazer	28,266
Clothes Frames	C. A. Boynton	28,961
Clothes Frames	W. Hathaway	28,983
Clothes Frames	C. J. Ferguson	29,151
Clothes Frames	A. Greenwood	29,163
Clothes Frames	S. T. Lamb	30,069
Clothes Frames	P. Cady	30,124
Clothes Sprinklers	S. N. Davis	30,565
Clothes Squeezers	F. Arnold	30,451
Clothes Squeezers	G. D. Trumppore	30,596
Clothes Wringers	R. O. Meldrum and A. B. Paxon	26,914
Clothes Wringers	E. Dickerman	27,781
Clothes Wringers	C. W. Higgins and A. S. Willard	28,752
Clothes Wringers	G. J. Colby	30,802
Clothes, Wringing	J. H. Clark	28,156
Clover, Hulling	J. D. Torrey	30,962
Clubs, Police	J. L. Rowe	27,335
Coal, Breakers for	P. Umholtz	27,581
Coal, Distillation of, Apparatus for	H. P. Gengembre	27,542
Coal, Excavating, Machines for	H. Wilverth	26,726
Coal, Machines for Breaking	G. E. Hoyt	27,220
Coal, Machines for Breaking	J. P. Sykens	27,191
Coal, Preparing	H. Mahew, Jr., and E. Mahew	27,373
Coal and Ores, Desulphurizing	W. H. Letterman	28,875
Coal and Ores, Purification of	J. Burroughs	27,689
Coal Screens	H. L. Cake	26,890
Cocks	B. Pickering	29,309
Cocks, Guard or Gas, forming	J. W. Lyon	27,228
Cocks, Oil	J. Hare	27,902
Cocks, Pull	G. Leach	28,588
Cocks, Stop	T. Daniels	27,112
Cocks, Stop	R. Nicolls	28,596
Cocks, Stop	H. A. Chapin	29,744
Cocks, Stop, Finishing plugs of	J. W. Lyon	27,370
Cocks, Stop, Operating	D. N. Dunzack	26,975
Cocks, Valve	R. Nickerson and A. B. Colton	28,192

Invention or Discovery.	Name of Patentee.	Number.
Cocks, Waste, for hydrants.....	G. W. Robertson.....	26,785
Coffee, &c., cleaning, drying, and polishing, Apparatus for.	W. Newell.....	30,083
Coffee Pots.....	W. Chesterman.....	26,889

Leather, Finishing	S. P. Cobb	28,562
Leather Goods, Water Proof	S. La Forge	27,337
Leather, Machines for crimping	H. Wing	29,429

Invention or Discovery.	Name of Patentee.	Number.
Leather, Machines for finishing.....	W. P. Martin.....	27,300
Leather, Machines for skiving.....	W. S. Williams.....	29,428
Leather, Machines for skiving.....	S. Keen.....	30,736
Leather, Machines for trimming, chamfering and skiving.....	W. H. Rounds.....	27,073
Leather, Oiling.....	L. Holcomb.....	30,320
Leather Paper, Stock Manufacture of.....	E. and J. R. Cushman.....	29,672
Leather, Polishing.....	R. A. Stratton.....	26,932
Leather Polishing Machines.....	G. S. Adler.....	27,028
Leather, Skiving.....	E. T. Ingalls.....	28,580
Leather Splitting Machines.....	J. F. Flanders.....	29,649
Leather Splitting Machines.....	S. S. Turner.....	30,553
Leather Splitting Machines, Feed of.....	D. H. Chamberlain.....	28,559
Leather Stretching Machines.....	J. H. Haskell.....	28,271
Leather, Tanned, treatment of.....	A. Dietz.....	30,393
Legs, Artificial.....	D. D. F. Douglass.....	26,753
Legs, Artificial.....	B. W. Jewett.....	29,494
Lemon Squeezers.....	L. S. Chichester.....	28,967
Lenses, Fluid.....	S. Kakeles.....	27,988
Letters, Copying, Apparatus for.....	A. L. Adams.....	30,283
Levels, Spirit.....	W. T. Nicholson.....	28,104
Levels, Spirit, attaching to a square.....	J. Steger.....	26,956
Levels, Surveyor's.....	S. D. Hailey.....	26,762
Lightning Arrester for Telegraphs.....	D. F. S. Ways.....	29,533
Lightning Rods.....	D. Wooster.....	29,933
Lightning Rods.....	N. Brittan.....	30,560
Lightning Rods, construction of.....	J. M. Patterson.....	29,398
Lightning Rods, insulating and supporting.....	M. Fox.....	27,977
Lights, Port, for Vessels.....	G. C. Courlay.....	30,519
Lights, Side, for Ships.....	E. Hidden.....	29,079
Lights, Street.....	J. H. Kalb.....	29,382
Life Preservers.....	N. Platt.....	27,066
Liquids, Evaporating.....	E. Constantine.....	28,158
Liquids, Evaporating.....	G. Stephenson.....	28,211
Liquids, Freezing.....	F. P. E. Carré.....	30,201
Liquids, Measuring.....	J. C. Ranken.....	28,690
Liquids, Measuring, Apparatus for.....	H. James.....	28,581
Liniments, Anti-rheumatic.....	J. A. Scheutz.....	27,389
Locks.....	L. Diss.....	26,659
Locks.....	G. and G. F. Ellicott.....	27,262
Locks.....	H. Isham.....	27,294
Locks.....	W. E. Worthen.....	27,854
Locks.....	L. Derby.....	28,162
Locks.....	A. Rankin.....	28,406
Locks.....	L. Yale, Jr.....	28,710
Locks.....	E. W. Brettell.....	28,828
Locks.....	C. F. Brown.....	29,120
Locks.....	W. H. Greenwood.....	29,588
Locks.....	E. P. Whitney.....	29,929
Locks.....	C. F. and C. F. Johnson, Jr., and W. W. Johnson.....	29,975
Locks.....	G. Rosner.....	30,092
Locks.....	J. L. Hall.....	30,140
Locks.....	W. S. Kirkham.....	30,580
Locks.....	L. Layman.....	30,606
Locks, Alarm.....	J. Ziegler.....	27,856
Locks, Burglar-proof Sockets for, &c.....	W. J. Scott.....	30,160
Locks, Canal and River.....	J. Davis.....	30,564
Locks, for Carpet Bags.....	Z. Walsh.....	26,959
Locks, Combination.....	J. H. Morse.....	30,830
Locks for Cotton Bales.....	A. P. Merrill, Jr.....	28,392
Locks, Door.....	H. Lockwood.....	28,092
Locks, Door.....	C. Adams.....	28,949
Locks, Door.....	J. E. Parker.....	30,586
Locks, Door.....	J. Kinger.....	30,654
Locks for Fire Arms.....	J. P. Lindsay.....	30,332
Locks, Freight Car.....	J. F. Keeler.....	30,229
Locks, Hoop.....	A. P. Merrill.....	28,694
Locks, Hoop, for metal bale hoops.....	C. H. Dubs.....	28,164
Locks, Knob.....	J. Adt.....	30,902
Locks and Labels, Sheaths for.....	S. W. Marsh.....	27,728
Locks, Permutation.....	W. A. Carpenter.....	27,202
Locks, Portable Door.....	E. G. F. Arndt.....	30,035
Locks, Seal, for railroad cars.....	J. H. Lyon.....	29,181
Locks, Sealing, for railroad cars.....	J. Clark.....	27,524
Locks, Table.....	W. Manheimer.....	28,093
Locks, Trunk.....	S. Bourne, Jr.....	28,056
Locks for Travelling Bags.....	S. Bourne, Jr., and J. G. Cunningham.....	28,057
Locks for Umbrella Stands.....	A. M. Foote.....	27,043
Looms.....	T. Lovelidge.....	27,136
Looms.....	J. J. Kendall.....	27,296
Looms.....	J. C. Cooke.....	27,860
Looms.....	H. Conant.....	27,889

Invention or Discovery.	Name of Patentee.	Number.
Looms	T. Clarkson.....	28,125
Looms	J. H. Clifton.....	28,453
Looms	L. R. Wattles.....	29,427
Looms	A. Parkinson.....	30,948
Looms, Harness Frames for	J. Greenhagh, Sr.....	28,270
Looms, Narrow ware	B. Hardy.....	28,135
Looms, Pattern Chain for	B. H. Jenks.....	29,283
Looms, Power.....	W. H. Gray.....	26,875
Looms, Power.....	M. A. Furbish and G. Crompton.....	29,873
Looms for weaving Hair Cloth	J. Angell.....	30,652
Lotions, Medicated.....	J. G. Popp.....	30,834
Lozenge Machines.....	R. Sowle.....	28,815
Lozenges, Cutting.....	W. J. McClelland.....	28,239
Lozenges, Making	G. Kober.....	28,381
Lubricating, Composition for.....	C. Chiterling.....	29,243
Lubricating Compounds.....	J. B. McMunn.....	26,693
Lubricating Compounds.....	V. Radspinner and W. H. Moss.....	29,005
Lubricating Engines, Method of.....	J. Marks.....	30,416
Lubricators	J. S. Lapham.....	27,548
Lubricators	E. B. and T. S. Parker.....	29,515
M.		
Mail Bags, &c., Labels for.....	T. P. Trott.....	28,023
Malt Kilns, Floors of.....	T. S. Smith.....	27,237
Malt Liquors, preserving and discharging.....	M. Reeder.....	26,930
Mangers.....	J. E. Kelly.....	27,812
Mangles.....	G. Coombs.....	27,890
Mangles.....	W. D. Grimshaw.....	30,812
Manure Spreader and Roller, combined.....	J. Lyker.....	30,179
Marble, Artificial, Manufacture of	R. Lamb.....	27,022
Marble, &c., Carving, Machines for.....	W. H. Pease.....	27,827
Marble, Polishing, Machines for	W. Emmett.....	27,538
Manganese, Oxide of, Manufacture of	C. T. Dunlop.....	29,474
Masts, Top, Attachment of Yards to.....	S. Hall.....	28,354
Match Cases	D. Ellis and P. Hine.....	27,974
Match Safes.....	L. Burnell.....	26,648
Match Safes, Pocket.....	A. M. Smith.....	26,865
Mattresses and Beds.....	F. Elder.....	29,066
Mattresses, Cutting Shavings for	F. Skinner.....	26,791
Mattresses, Life-preserving.....	L. Banhoefer.....	30,794
Mattresses, Spring	H. Jury.....	29,600
Mattresses, Spring.....	L. Whitehead and S. P. Kittle.....	29,846
Mattresses, Ventilating, Spring.....	R. W. Geraghty.....	27,667
Meat Choppers	C. B. Becker.....	28,145

Mill Bushes.....	J. G. Shafer.....	29,013
Mill Bushes.....	E. Casner.....	30,296
Mill Race, Floating Sluices for.....	M. A. Shepard.....	28,204
Mill Stones, Balancing.....	D. Fellenbaum.....	29,869
Mill Stones, Bush.....	M. French.....	27,709
Mill Stones, Cementing.....	S. Hoyt.....	28,083
Mill Stones, cooling and grain cleaning when fed to the mill.	W. H. Aikins and D. Babcock.....	28,643
Mill Stones, Curb for.....	O. L. Richardson.....	29,617
Mill Stones, Dress.....	J. W. Gaines.....	28,850
Mill Stones, Dress for.....	C. V. Littlepage.....	27,551
Mill Stones, Dress for.....	J. Broughton.....	28,344
Mill Stones, Dressing.....	I. Yorbrough.....	26,943
Mill Stones, Dressing.....	J. Bowman.....	28,553
Mill Stones, Dressing.....	C. D. Brewer.....	29,857
Mill Stones, Dressing, grinding diamonds for.....	B. D. Tripp.....	30,995
Mill Stones, Dressing Machines for.....	G. Z. Hockenburg.....	29,275
Mill Stones, Dressing Machines for.....	M. Shirk.....	29,345
Mill Stones, Dressing Machines for.....	M. H. Bacon.....	29,350
Mill Stones, Dressing Machines for.....	S. K. Lands.....	29,701
Mill Stones, Hanging.....	J. H. Glover.....	28,362
Mill Stones, Hanging.....	G. P. Dance.....	28,534
Mill Stones, Hanging.....	Z. McDaniel.....	30,025
Mill Stones, Levelling.....	D. A. Balmer.....	31,454
Mill Stones, Picking.....	E. M. Daniels.....	26,857
Mill Stones, Picking, Machines for.....	J. Kelly.....	29,748

Invention or Discovery.	Name of Patentee.	Number.
Mill Stones, Ventilating.....	G. P. Plant and J. Raith.....	30,498
Mirrors, Composition for Silvering	H. Poissonnier	28,773
Mirrors, or looking glasses.....	S. F. Brooks	27,965
Moles, Adjustable, for mole ploughs	L. Kazer.....	29,601
Mole for drain ploughs	A. B. Hawkins and J. Puntenny.....	28,667
Mop Heads	J. Doty, Jr.....	29,148
Mop and Scrubber combined	R. Price.....	27,383
Mop Wringers	O. Choate.....	28,257
Mortising or boring machines, Feed motion for	J. M. Kendall	27,134
Mortising Machines.....	F. H. Harwood.....	26,986
Mortising Machines.....	W. Nangel.....	27,145
Mortising Machines.....	A. C. Vaughn	27,397
Mortising Machines.....	L. Eames	27,895
Mortising Machines.....	E. Coffin	29,141
Mortising Machines.....	H. C. Smith.....	29,920
Mortising Tools.....	T. Board and C. N. Austin.....	26,745
Mortising Tools.....	L. Eames	27,782
Mosaics, Wooden, Manufacture of.....	L. De Forrest.....	26,898
Motion, Converting	L. Planer.....	28,403
Motion, converting reciprocating into rotary.....	C. B. Parsons.....	27,307
Motion, converting reciprocating into rotary.....	J. Hathaway	27,715
Motion, converting reciprocating into rotary.....	E. Matteson	29,802
Motion, converting rotary into reciprocating rectilinear.....	W. H. Lazelle.....	27,057
Motion, Machinery for Changing.....	C. L. Pyron and R. Bruce.....	26,709
Motion of Picker Staff	E. H. Graham	30,441
Motion, stopping and changing.....	F. A. Pratt	29,939
Motion, transmitting to machinery.....	W. Phelps	29,000
Motive Powers	L. D. Towsley and E. Matteson	29,329
Motive Powers, adaptation of substances as.....	F. M. Ruschhaupt	27,569
Motive Powers, engines for obtaining, from steam, aeri-form, or gaseous fluids under pressure.	J. W. Durham.....	29,149
Motive Powers, obtaining	J. Pringle	29,303
Motors, Hydraulic.....	W. Kennish	28,282
Moulded Articles, Elastic	Du Bois Parmelee	26,861
Moulding Machines	E. M. Smith.....	27,261
Moulding Machines, adjusting the planes in.....	W. D. Jones	27,986
Moulding Machines, Brick	J. J. Hutchinson and J. D. Brandberg.....	30,406
Moulding parched corn balls, Machines for.....	R. Arnold	30,661
Mouldings	J. Dougherty	28,260
Mouldings, Cutting.....	C. B. Rogers	26,787
Mouldings, Enamelling.....	R. Ten Eyck, Jr	28,022
Mouldings, Enamelling.....	G. Boss	30,954
Mouldings for hanging pictures.....	H. Hochstrasser	28,174
Mouldings, Machines for Cutting.....	J. B. Winslow.....	28,527
Moulds, Brick.....	J. A. Hamer.....	26,736
Moulds, Brick.....	J. F. Schuffenecker.....	27,652
Moulds, Brick.....	M. Elder	29,958
Moulds for Casting.....	S. A. Corser.....	29,123
Moulds for Casting, Blackwashing	W. and D. Ferguson.....	27,438
Moulds for casting needle threaders.....	S. S. Burlingame	29,230
Moulds, Facing, for casting metals.....	J. B. Hyde	28,379
Moulds, Glass.....	C. H. Warren.....	27,873
Moulds, Glass.....	G. W. Scollay	30,093
Moulds for glass goblets, &c.....	A. J. Sweeney.....	29,017
Moulds for glass jars	R. Hemingray	30,063
Moulds for glass lamps	J. Jenkins.....	30,066
Moulds for jars	G. Scott.....	28,611
Moulds for metal dies used by dentists	F. Y. Clark.....	28,348
Moulds for moulding cement pipes.....	H. Knight	28,184
Moulds for rifle balls	L. Evans.....	30,054
Movements, Mechanical	J. H. Wait	28,318
Mowing Machines	O. R. Chaplin	26,814
Mowing Machines	S. Ray and M. R. Shalters	27,869
Mowing Machines	A. M. George.....	28,072
Mowing Machines	C. Bullock	28,628
Mowing Machines	A. B. Allen	29,228
Mowing Machines	J. W. Shipman	29,325
Mowing Machines	F. Gardiner.....	29,371
Mowing Machines	F. W. Warner.....	29,425
Mowing Machines	H. Marcellus	29,895
Mowing Machines	J. G. Dunham	30,961
Mowing Machines, hand	J. M. Spencer.....	29,922
Mowing and Reaping Machines	R. Ketchum	28,283
Mowing and Reaping Machines	V. M. Chafee.....	27,523
Musical Instruments	U. Hill and H. J. Newton	27,288
Musical Instruments	A. White.....	28,224
Musical Instruments, keyed, automatic attachment to.....	E. D. Bootinan	30,955
Musical Instruments, Reed.....	G. Woods	28,230
Musical Reeds.....	J. C. Briggs.....	28,060
Musquito Bars.....	T. S. Scoville.....	27,236
Musquito Nets and Shades for windows.....	R. B. Burchell.....	27,103

Invention or Discovery.	Name of Patentee.	Number.

Ores, Mineral, Machines for crushing	W. P. Parrott	28,499
Ores, Separators of	E. L. Seymour	29,198
Ores, Separators of	S. Man	29,438
Ores, Separators of	W. O. Bourne	30,290
Ores, Washers of	G. E. Mills	27,463
Ores, Washers of	B. O'Bryan	30,086
Ores of Zinc, Lead, Iron, Cobalt, and Nickel, metal- lurgic application to certain	R. George	27,710
Orthography, teaching, &c	H. B. Brown	27,201
Ovens	D. McKensie	28,130
Ovens	J. M. Read	29,818
Ox Shoes	A. Van Valkenburgh	28,218
P.		
Padlocks	W. Bohannon	27,883
Padlocks	F. Roos and F. Spoehr	29,406
Padlocks	J. North	31,003
Pads, Medicated	W. D. Titus	26,719
Pails, Milk, straining	H. Buckins	30,046
Painting Bottoms of Vessels, &c., Compositions for	J. G. Fuller	27,331
Paints, Composition for	E. P. Emerson	27,280

Invention or Discovery.	Name of Patentee.	Number.
Paints, Composition for mixing with	U. Lee.....	26,685
Paints, Machines for mixing	C. W. Brown and G. W. Banker	28,324
Paints, mixing.....	S. P. Cheever.....	28,560
Pans, Evaporating	H. O. Ames	30,443
Pans, square, of sheet metal, manufacture of.....	E. M. Roxford	30,545
Pantaloons	W. Franklin	26,842
Paper Bags, Machines for	H. G. Armstrong	30,191
Paper Files.....	E. Clark.....	28,234
Paper Files.....	A. Liebenroth	28,438
Paper Files, Portfolio	J. N. Jacobs	28,755
Paper, folding, for bookbinders.....	G. K. Snow	27,166
Paper Folding Machines	C. Chambers, Jr.....	30,719
Paper Folding Machines	J. S. Gallaher, Jr.....	30,853
Paper Folding Machines	C. Chambers, Jr.....	30,910
Paper Folding and Pasting Machines	G. K. Snow	27,392
Paper and Letter Files.....	J. B. McEnally	27,302
Paper, Preparation of	J. L. Jullion.....	28,182
Paper Pulp, Manufacture of	E. Clemo.....	29,059
Paper Pulp, Manufacture of	F. De Campoloro	29,471
Paper Safety	M. A. Howell, Jr	28,370
Paper Trimming	J. Knoch.....	29,891
Paper Wetting, Machines for.....	A. Overend.....	28,895
Parasols.....	A. G. Davis and H. S. Frost.....	30,127
Parasols and Fans.....	J. T. Eichberg.....	30,213
Parchment, Vegetable, Manufacture of.....	X. Karcheski.....	30,946
Paste for attaching coverings to piano forte hammers..	J. Munson	28,768
Pastry Board	L. E. Higby.....	26,989
Patterns, Waving, Machines for making	A. Moffet.....	29,901
Pavements, &c., Composition for.....	G. Scrimshaw	29,722
Pavements, mode of making.....	S. D. Tillman	27,658
Paving Rammers for Streets.....	W. Beach.....	30,042
Pawl and Ratchet	E. P. Russell	29,310
Peach Parers	M. Smith.....	28,310
Peach Parers	W. A. Coe	30,527
Pegging Boots and Shoes, Machines for.....	W. N. Hawley	26,987
Pegging Jacks	E. Everson	29,257
Pegging Jacks	E. L. Harlow.....	29,434
Pegging Machines	E. Townsend.....	27,085
Pegging Machines	J. J. Greenough.....	28,852
Pegging Machines	P. Wells	30,950
Peg Machines, Shoe	C. A. Priest	29,519
Pegs, Shoe, Pointing, Machines for.	S. G. Brett	29,565
Pendulum, Compensating.....	G. Buchanan.....	30,798
Pens, Cleaners for	J. Warren.....	30,270
Pens, Fountain	E. Mathers.....	30,828
Pens, Fountain	G. W. Woolley	30,851
Pens, Fountain	S. A. Skinner	30,935
Pens, Gold, Rolling.....	A. Morton.....	29,809
Pens, Holders for	A. F. Warren.....	28,797
Pens, Holders for	J. Warren.....	29,426
Pens, Ink Reservoir for	R. B. Fitts	28,235
Pens, Racks for.....	J. Young.....	26,727
Pens, Stands for.....	C. J. Rooney and D. Renshaw	27,739
Pen Rack, Cleaner, and Pencil Sharpener.....	H. C. Haskell	27,287
Pens and Pencils, Cases for	J. Richardson	27,311
Pens and Pencils, Cases for.....	J. Bockburn.....	27,777
Pens and Pencils, Cases for.....	G. E. Frew.....	28,664
Pens and Pencils, Cases for.....	G. E. Frew.....	29,432
Pessaries	F. F. Wells.....	27,491
Pessaries	J. M. Heard	28,480
Pessaries, Elastic	I. A. Wadsworth.....	26,941
Photographic Baths.....	W. and W. H. Lewis.....	28,876
Photographic Medals.....	D. F. Maltby	29,652
Photographic Paper, box for silvering and albuminizing.	E. C. Thompson and J. M. B. Wheaton...	29,418
Photographic Plate Shield.....	W. Campbell.....	27,269
Photographs, Solution for toning.....	J. C. Rutherford.....	27,076
Piano Fortes	S. B. Driggs	27,435
Piano Fortes	J. A. Gray.....	28,137
Piano Fortes	J. U. Fischer.....	29,068
Piano Fortes	G. H. Hulskamp.....	29,081
Piano Fortes	H. Lindeman.....	29,502
Piano Fortes	F. Mathushek	30,279
Piano Fortes, Grand.....	F. C. Lighte.....	27,226
Piano Fortes, Keys for.....	H. W. Hindsley.....	27,050
Piano Forte Action.....	I. Kohull.....	26,909
Piano Forte Action.....	W. Compton	28,352
Piano Forte Action.....	G. H. Hulskamp	28,374
Piano Forte Action.....	F. W. Niehaus.....	28,997
Piano Forte Hammers, Paste for attaching coverings to.	J. Munson	28,768
Pianos, Bridges for	W. Compton	29,061
Pianos, Tuning.....	J. B. Norris	28,998
Picks	J. C. Reed.....	28,638
Picture Frames, &c., Enameling Tools for.....	J. Sperry.....	29,122

Invention or Discovery.	Name of Patentee.	Number.
Picture Frames, &c., Enamelling	R. Marcher.....	29,609
Pictures on Glass, Backing up.....	T. Fry	25,733
Pictures, Transparent, Preparation of.....	G. Wedekind.....	30,649
Pie Crimpers	C. A. Shaw.....	30,592
Pigs, Apparatus for singeing.....	A. and E. M. Denny	30,467
Piles, Driving, by atmospheric pressure.....	W. S. Smith	29,921
Pins, Diaper.....	H. S. Leshner	30,232
Pins, Fastening.....	D. Brown	27,519
Pins, Iron Coated, making.....	De G. and T. Fowler	26,874
Pins, Manufacture of	T. and De G. Fowler	29,431
Pins, Scarf	W. Sherburne.....	27,479
Pipes, Casting	A. Brady.....	30,044
Pipes, Construction and Joining of.....	T. S. Truss.....	29,731
Pipes, Exhaust. Locomotive Engines.....	G. W. Lathrop	30,976
Pipes, Gas.....	W. Stephenson.....	29,111
Pipes, Gas and Water, Tapping	J. J. Watson	30,901
Pipes, Hawse.....	T. J. Southard.....	27,482
Pipes, Hawse.....	C. Perley.....	30,755
Pipes, Iron, Galvanized, Cleansing.....	W. Blake.....	27,663
Pipes, Iron, Moulding.....	W. Doyle.....	28,261
Pipes, Machine, Clay	S. Ustick.....	27,602
Pipes, Metal, Moulding.....	H. Parmelee.....	29,908
Pipes, Organ	J. Gorham.....	27,443
Pipes, Sheet Metal, Making.....	E. T. Boardman.....	28,147
Pipes, Stove.....	L. Bissell	30,952
Pipes, Stove, Machines for forming.....	J. Rogers.....	29,405
Pipes, Variable Exhaust for Steam Engines	G. Edwards	27,020
Pipes, Water, Attaching to Buildings	W. Austin	28,954
Pipes, Water, Tapping.....	J. Drake	30,051
Pistons, Lubricating	B. Garvey.....	29,216
Pistons for Steam Engines	H. D. Dunbar.....	29,576
Pistons for Steam Engines	J. K. Robinson and J. M. Clark.....	29,621
Pistons for Steam Engines	T. S. La France.....	30,328
Pistons for Steam Engines	J. K. Robinson and J. M. Clark.....	30,351
Pitchers, Beer.....	L. Hermance.....	27,904
Pitchers, Beer.....	O. Z. Pelton.....	28,771
Pitchers, Ice	N. F. Griswolds	28,076
Pitchers, Spout and Lid of.....	D. Baker.....	28,726
Planers, Rotary, Arrangements of parts in.....	A. J. Kramer.....	30,903
Planes, Bench.....	H. C. Hunt.....	27,983
Planes, Edge, for Boots and Shoes.....	E. S. Smell	27,840
Planes, Moulding.....	C. Fleming.....	29,962
Plane Iron Sharpeners	J. Turner	28,946
Planing Machines.....	S. S. Gray.....	26,902
Planing Machines.....	W. N. Manning	29,089
Planing Machines.....	B. Fitts	29,369
Planing Machines.....	H. D. Stover	29,728
Planing Machines.....	H. D. Stover	29,923
Planing Machines, Rotary Cutter-head for.....	T. Christian.....	29,768
Planing Mouldings, Machines for.....	W. Rankin.....	29,992
Planing, Rotary Cutter-heads for.....	H. D. Stover	29,633
Planing Warped Surfaces, Machines for	J. Green.....	28,808
Planing Wood, Machines for.....	H. D. Stover	30,993
Planting Cotton Seeds	W. Price.....	28,602
Planters, Corn.....	A. Anable.....	26,642
Planters, Corn.....	J. Gross.....	26,670
Planters, Corn.....	D. Nichols	26,700

Saws.....	J. E. Emerson	27,537
Saws.....	P. Crosby	27,779
Saws.....	D. Talbot.....	30,265
Saws, Circular, construction of.....	R. K. Hawley.....	27,628
Saws, Circular, grinding	J. Andrews.....	30,190
Saws, Circular, hanging.....	D. Eldridge.....	30,672
Saws, cutting, Die Plate for	E. P. Gleason.....	28,747
Saws, Filers for	J. S. Tripp	27,937
Saws, filing	P. Crosby.....	26,838
Saws, filing	P. McMahon	28,094
Saws, Gin, filing.....	S. Yeatman	30,442
Saws, grinding	H. R. Burger	29,950
Saws, grinding, Machine for.....	W. Dougherty	28,742
Saws, grinding, Machine for.....	W. Dougherty	30,130
Saws, grinding, Machine for.....	J. D. Custer	30,209
Saws, grinding and polishing	C. W. Hubbard.....	27,221
Saws, Handles to, fastening.....	J. Neimeyer	27,303
Saws, Reciprocating, hanging.....	Leo. Anderson.....	26,823
Saws, Muley, adjusting Rakes of.....	C. W. Griffith	30,214
Saws, Reciprocating	C. Germann	29,688
Saws, Reciprocating, adjusting Rakes of.....	J. J. Watson.....	30,523
Saws, Reciprocating, hanging	C. Weston	28,223
Saws, Scroll, Device for straining	C. Rose	29,009
Saws, tempering.....	W. Clemson.....	29,671
Saws, Wood	A. Pruyn	29,991
Saw Blades, Buck, Device for contraction or expansion of.....	A. Pruyn.....	27,240
Saw Blades, grinding	H. Disston.....	29,680
Saw Frames, Wood	W. H. Livingston.....	30,073
Saw Frames, Wood	W. H. Livingston.....	30,076
Saw Logs, rossing	C. H. Stearns	27,081
Saw Sets	A. L. Carrier	28,252
Saw Sets	W. Clemson.....	29,670
Scabbards, attaching, to belts.....	Wm. Lewis	26,949
Scabbards, Bayonet, Frogs for.....	W. Hoffman.....	28,175
Scabbards, Bayonet, manufacture of.....	E. Gaylord	28,269
Scaffolding	E. Duchamp.....	26,840
Scaffolding Brackets, securing, to buildings.....	T. J. Gifford.....	27,441
Scaffolds, Builders'	J. K. Lemon	27,815
Scaffolds, Portable	R. M. Lytle.....	29,607
Scaffolds, supporting.....	J. K. Lewis	29,086
Scales	H. N. and J. C. Bill.....	27,683
Scales, Grain.....	C. H. Hunter	28,236
Scales, Grain, Automatic.....	A. Gummer	27,712
Scales, Platform	J. Holcomb.....	30,922
Scalpels	A. G. Shaver	30,696
Scissors	F. B. Bowman	27,685
Scissors	J. G. De Coursey	29,250
Scissors and Nippers.....	H. D. Walcott.....	27,531
Scraper and Brush, Foot	H. Warren	30,859
Scrapers, Foot.....	E. G. Burger	29,568
Scrapers, Road	N. Peck.....	26,704
Screws, Heel, for skates.....	J. Heath	27,215
Screws, making	J. Griggs	29,373
Screws, Tobacco	N. Hoag and W. H. Tappey.....	27,631

Invention or Discovery.	Name of Patentee.	Number.
Screws, Wood	G. Freeman	29,963
Screws and Nuts, anti-friction	C. F. Spencer	28,613
Screw Plates	Z. L. Jacobs	28,279
Screw Threads, serrating edge of, on rollers	W. H. Howard	27,129
Scumming, Apparatus for	T. Molinier	30,339
Scythe Fasteners	C. L. Barritt	29,661
Scythes, hardening, Machines for	A. Holman and O. A. Kelly	29,973
Seaming Machines, double	L. T. Hulbert	26,679
Seats, Car	F. I. Palmer	27,469
Seats, Car	S. McGregor	27,645
Seats, Car, Bolts for	C. A. McEvoy	28,190
Seats, Carriage, adjustable	I. L. Vansant	28,792
Seats, Carriage, adjustable	J. A. Naylor	28,892
Seats, Carriage, extension	J. A. Naylor	29,709
Seats, Carriage, sliding	W. A. Bird	27,881
Serts, Chair	L. B. Batcheller	30,022
Seats, Drivers', for mowing and reaping machines	F. Getz	30,572
Seats, Pic-Nic or Excursion	J. M. Perkins	30,344
Seats, Water Closet	K. Spencer	26,866
Seats, Water Closet	G. C. Hinman	30,574
Seat and Cane, combination of	J. K. Andrews	28,643
Seats and Couches, Car	D. Pennoyer	29,813
Seats and Couches, Railroad Car	T. T. Woodruff	26,942
Seats and Couches, Railroad Car	J. H. Fisher	30,472
Seats and Couches, Railroad Car	E. Burke	30,517

Tires, upsetting.....	H. Barringer.....	28,728
Tires, upsetting.....	J. Olmstead and W. A. Walker	29,573
Tires, upsetting, Machines for.....	C. V. Statler	29,529
Tires, &c., Upsetting, Machines for.....	O. Foster.....	29,477
Tires, Wagon, Apparatus for heating.....	J. N. Whitaker.....	28,721
Tires on Wheels, Adjusting	W. S. Harrison.....	28,982
Tobacco, Straightening and Pressing.....	W. W. Justis.....	29,976
Toilets, Composition for.....	S. American.....	29,944
Toombstones	T. Windell.....	28,029
Tongs and Shovel, Combination of.....	J. W. Evans	28,264
Tools, Edge, Manufacture of.....	S. W. Collins	30,658
Tools, Holders for.....	S. Stevens	30,548
Torches for night processions.....	J. Edge.....	28,661
Trace Fasteners	S. Walker.....	29,847
Traces, Safety bar, for vehicle	R. Rolph	27,566
Traps, Air, for steam engines	T. Sault.....	27,313
Traps, Animal.....	R. P. Buttles	26,883
Traps, Animal.....	J. P. Wilson	27,017
Traps, Animal.....	V. O. and J. R. Spencer	27,080
Traps, Animal.....	W. Tinsley	27,083
Traps, Animal.....	L. W. Buxton.....	27,967
Traps, Animal.....	W. Wright.....	28,820
Traps, Animal.....	G. Slusser.....	29,627
Traps, Animal.....	H. Y. Wildey	30,269

Invention or Discovery.	Name of Patentee.	Number.
Traps, Ant	G. W. Cottingham and J. S. Menefee.....	29,468
Traps, Fly.....	H. H. Robertson.....	29,008
Traps, Fly.....	S. S. Day	30,619
Traps, Moth	J. W. Heard.....	27,048
Traps, Rat.....	A. Hunter.....	26,947
Traps, Rat.....	H. A. Ridley	27,071
Traps, Rat	L. Parker	29,190
Traps, Steam.....	A. Lapham.....	26,950
Traps, Steam.....	Frank Douglas.....	27,040
Traps, Steam.....	L. Ferguson.....	27,625
Traps, Steam.....	S. Lee	27,914
Traps, Steam.....	C. C. Walworth	28,795
Traps, Steam.....	N. Upham	29,833
Traps, Stench, for sinks.....	A. Carson.....	30,121
Traps for water closets	H. Boyd.....	27,612
Treadle connection for machinery	A. A. Raymond.....	29,994
Trees, Device for sustaining.....	W. A. Livingston	30,584
Trees, Felling	P. Johnson.....	28,280
Trees, Felling, Machines for	A. P. Torrence	29,019
Trees from insects, Apparatus for preserving	N. Potter, Jr.....	29,098
Trees, Protectors for	W. W. Taylor.....	29,730
Trees, Pruning, Instruments for	D. P. Chamberlin..	29,669
Troughs, Eave.....	G. M. Selden.....	30,934
Troughs, Eave, Machine for making.....	W. H. Henderson.....	28,369
Troughs, Eave, Machines for making.....	L. Mann	27,916
Troughs, Eave, Making	L. Pierson	28,901
Trucks for fire ladders.....	G. B. Mickle and J. M. Carville	27,820
Trucks, Hand	J. Underkoffler	28,024
Trucks for locomotives.....	D. R. Pratt	30,421
Trunks.....	E. A. G. Roulstone	27,476
Trunks.....	S. Bourne, Jr.....	29,458
Trusses	H. Dalton	28,972
Trusses, Belt	J. C. Rainbow.....	29,403
Trusses, Hernial, construction of	L. B. White.....	29,737
Trusses, Hernial, Spring	D. L. D. Sheldon	29,410
Truss Bridges, Plates for securing the chords, braces, &c., of.	F. C. Lowthrop	27,457
Truss Girders, Iron	W. Murphy	28,240
Tubes, Boiler, Drawing	S. J. Perry	29,715
Tubes, Gas, Flexible.....	J. Butler	28,647
Tubes, Gas, Flexible, Manufacture of.....	T. J. Mayall.....	29,898
Tubes, Making	S. J. Hayes	28,479
Tubes, Metallic, Galvanoplastic Coating for the interior of.	J. Mathews, Jr.....	28,590
Tubes, Oesophagus	N. Q. Munger	29,092
Tubes, Seamless, forming	C. E. L. Holmes.....	29,276
Tubes for spinning frames.....	D. D. Allen..	29,451
Tubs, Bathing, India rubber, Portable.....	J. W. Ramsay and D. Wilson	29,914
Tubs, Distiller's mash.....	D. P. Patterson.....	29,713
Tuck and plait folders.....	R. Brady	29,855
Tufted work, Manufacture of.....	E. Kellermann	27,133
Tumblers, &c., Apparatus for cleaning.....	T. S. Harris	27,286
Tunnels, Tubular, Sub-marine.....	A. Folsom.....	26,665
Turning Machines	G. Rugg	30,646
Turning ovals	J. S. Barber	29,852
Turnouts, Street railroad.....	H. Tupper	30,940
Tuyeres	C. H. Thompson.....	27,089
Tuyeres	A. Ordway.....	28,296
Tuyeres	M. Mead.....	28,680
Tuyeres	S. V. Folman and N. F. Blodget.....	29,114
Tuyeres	C. H. Edwards	30,805
Twine holders	T. W. Brown	27,101
Type Metal, Coating, with brass.....	J. Corduan	29,144
Types, Embossed, casting	J. C. Bryant.....	30,293
Type Scouring, Machines for.....	J. G. Pavyer.....	28,899
Type Setting	H. Harger.....	28,857
Type Setting	D. B. Dorsey and E. Mathers.....	30,211
Type Setting, Machines for	C. W. Felt.....	28,463
Typography.....	J. Collignon and L. George	28,702
U.		
Umbrellas	J. P. Schenkl.....	29,721
Umbrella Sticks, Preparing wood for.....	J. Ball	29,851
Uterine supporters	G. Kleinworke	30,410
V.		
Valves	J. and C. B. Hardwick.....	30,815
Valves, Alarm, for steam boilers.....	S. Dustin.....	28,165
Valves, Balance Slide.....	J. Sloan.....	27,011
Valves, Combined Pressure and Vacuum, for steam boilers.	D. R. Prindle.....	29,004

Invention or Discovery.	Name of Patentee.	Number.
Valves, Cut-off, for steam engines.....	G. Frost.....	30,138
Valves, Governor.....	G. H. Timmerman.....	28,166
Valves, Governor, for steam engines.....	E. Armstrong.....	27,677
Valves, Governor, for steam engines.....	P. L. Weimer.....	27,752
Valves, Governor, for steam engines.....	W. Chambers.....	28,065
Valves, Governor, of steam engines, Actuating.....	P. L. Weimer.....	27,939
Valves, Governor, for steam engines, Operating.....	W. G. Crutchfield ..	27,275
Valves for hydrants.....	M. C. Meigs.....	28,391
Valves for oscillating engines.....	L. W. Langdon.....	30,826
Valves, Oscillating, for steam engines.....	G. Burnham.....	30,176
Valves, Pump.....	W. Jeffers.....	27,909
Valves, Safety, to boilers, Spring Balances for.....	C. Graham.....	30,966
Valves, Safety, for steam boilers.....	W. M. Storm.....	28,111
Valves, Slide.....	N. Sutton.....	27,168
Valves, Slide.....	J. Millholland.....	30,150
Valves, Slide.....	J. Randall.....	30,184
Valves, Slide.....	R. C. Bristol.....	30,611
Valves, Slide.....	T. Mahoney.....	30,827
Valves, Slide, for steam engines.....	J. T. Plass.....	27,381
Valves, Slide, for steam engines.....	G. W. Raines.....	27,384
Valves, Slide, for steam engines.....	T. Stewart.....	27,394
Valves, Slide, for steam engines.....	E. M. Lewis.....	28,718
Valves, Slide, for steam engines.....	L. P. Rice.....	29,822
Valves, Slide, of steam engines, arrangement for balancing.	A. Buchanan.....	28,251
Valves, Steam.....	M. Cridge.....	26,654
Valves, Steam.....	L. Bennett.....	28,552
Valves, Steam.....	J. F. Letellier.....	30,485
Valves of Steam Engines.....	G. W. Van Deren.....	30,365
Valves of Steam Engines.....	H. E. Woodford.....	30,550
Valves of Steam Engines, Operating.....	A. J. Laird.....	30,329
Valves of Steam Engines, Operating.....	L. H. Bowman.....	30,956
Valves, Steam Trap.....	J. Avery, Jr.....	27,769
Valves, Stop.....	J. Higginbotham.....	27,801
Valves, Vacuum, for water-heating apparatus.....	J. E. Boyle.....	28,058
Valves, Ventilating, for delivery of fluids.....	W. S. Meade and H. W. Dopp.....	27,230
Valves for water closets.....	J. E. Boyle.....	26,645
Valves for water closets.....	W. S. Carr.....	27,522
Valves for water closets.....	W. S. Carr.....	30,462
Valve Chest for handralic mining.....	M. A. Winham.....	26,740
Valve Gear, Eduction, for steam engines.....	A. Crosby.....	27,432
Valve Gear, Induction, for steam engines.....	A. Crosby.....	27,431
Valve Gear for Steam Engines.....	J. King.....	26,908
Valve Gear for Steam Engines.....	P. Kenney.....	29,604
Valve Gear for Steam Engines.....	P. Louis.....	29,844
Valve Gear for Steam Engines.....	J. J. Gwynn.....	30,676
Valve Gear for Steam Engines.....	J. R. Jacob.....	30,923
Valve Seats of Steam Engines, Planing.....	C. B. Long.....	30,234
Varnish, Mode of Polishing.....	W. R. Bennett and C. Storer.....	28,956
Varnishes.....	G. A. Engelhard.....	27,540
Varnishes.....	A. Sebatier.....	27,833
Vapor, Hydro-carbon, for illuminating.....	W. H. Laubach.....	27,190
Vapor for Medical Purposes, Apparatus for forming.....	J. Gardette and H. Rance.....	26,667
Vapor Apparatus, Hydro-carbon.....	F. S. Pease.....	27,470
Vegetable Slicers.....	S. T. Sandford.....	28,412
Vehicles, Locomotive, for running on ice or water.....	N. Wiard.....	26,960
Vehicles, Running Gear of.....	F. L. Kidder.....	30,482
Vehicles, Velocipede.....	S. W. Barr.....	30,191
Veneers, Chamfering, Machine for.....	G. Williamson.....	29,942
Veneers, Cutting.....	P. Weiler.....	27,326
Veneers, Cutting, Machine for.....	D. Donalds.....	27,893
Veneers, Cutting, Machine for.....	G. Knoch and A. Stoeckel.....	27,991
Veneers, Mosaic.....	O. Heinigke and M. Laemmel.....	28,481
Veneers, Sawing spirally from the log, Machines for..	B. F. and I. T. Barker.....	27,420
Ventilating Apparatus.....	G. B. Clarke.....	27,204
Ventilating Sinks of Water Closets.....	W. G. Mackey.....	26,773
Ventilation of Bulk Windows.....	S. R. Mason.....	26,918
Ventilation of Casks Containing Liquids.....	L. Wilhelm.....	28,798
Ventilation for Hats.....	J. McManus.....	26,692
Ventilation for Hats.....	J. Jenkinson.....	27,985
Ventilation of Railroad Cars.....	E. B. Forbush.....	27,212
Ventilation of Railroad Cars, Apparatus for.....	C. Newcomb.....	30,340
Ventilators.....	G. Colhoun.....	26,967
Ventilators.....	W. Chadwick.....	27,405
Ventilators, Hat.....	J. Pollock.....	27,736
Ventilators, Hat.....	F. H. Bell.....	29,050
Ventilators, Railroad Car.....	A. Hapgood.....	28,365
Ventilators, Railroad Car.....	R. B. Wright.....	30,515
Vermin, Apparatus for Destroying.....	L. Disbrow.....	29,366
Vessels, Centre-board for.....	D. C. Gerard.....	28,979
Vessels, Centre-board, Construction of.....	C. R. Ketchum and W. L. Hunt.....	29,085
Vessels, Construction of.....	T. Bell.....	27,328
Vinegar, Machine for Manufacture of.....	F. M. Ruschhaupt.....	29,407

Invention or Discovery.	Name of Patentee.	Number.
Vinegar, Manufacture of.....	J. Palmer.....	29,550
Vise.....	T. B. Lamb.....	28,382
Vise, Engraver's.....	A. H. Wood.....	27,253
Vise Bench.....	L. A. Beardsley.....	27,960
W.		
Wagons.....	N. Jenkins.....	29,598
Wagons, Dumping.....	G. W. Tolhurst and D. E. Sartwell.....	28,216

Winnowing Machine	F. H. Manny	30,334
Wires, Friction, making.....	D. J. Ferry	29,259
Wires, Steel and Iron, rolling	J. Wright	30,782
Wood, bending, Machines for	A. Rogers	27,568
Wood, bending, Machines for	C. L. Nelson and O. Bostwick.....	27,672
Wood, bending, Machines for	F. Seidle and S. Eberly	29,107
Wood, bending, Machines for	A. P. Spaulding and E. Pierce.....	30,004
Wood, bending, Machines for	D. B. Hedden	30,404
Wood, bundling	W. S. Williams.....	28,243
Wood, Fire, bundling	C. J. Hobe.....	28,753
Wood and metal, finishing works in	G. Storer	28,818
Wood, polishing, Machines for	G. Munger.....	27,953
Wood, preparing and moulding into different forms	P. Shaw.....	28,309
Wood Slivers, Machines for reducing	W. H. Noyes	27,597
Wooden Ware, making	A. Howard, Jr.	27,803
Wool, burring	E. I. McCarthy	26,775
Wool, removal of burs from	C. L. Harding	28,476
Woolen Rovings, Machines for winding.....	J. A. Chapman	30,958
Wrenches	I. E. Niell.....	26,951
Wrenches	A. C. Richard	27,090
Wrenches	G. B. Phillips.....	28,300
Wrenches	A. I. Gove.....	28,665
Wrenches	R. P. Butties	28,964
Wrenches	E. S. Scripture	29,826
Wrenches	W. Kearney	30,579
Wrenches	F. W. Kroeber.....	30,975
Wrenches	E. Ripley.....	30,987
Wrenches	E. Ripley.....	29,620
Wrenches and Pincers	I. H. Doolittle	27,622
Wrenches, Pipe.....	W. F. Beecher	28,053
Wrenches, Pipe.....	G. C. Taft.....	30,431
Wrenches, Screw.....	L. and A. G. Coes	29,360
Wrenches, Screw, Machines for heading.....	L. and A. G. Coes	28,157
Wrenches, Screw, Rolling Shanks and Bars of.....	W. Russells	29,623
Wrenches and Vises.....	P. D. Van Hoesen	30,268
Wrenches, Wagon.....	S. A. Bailey.....	27,609
Wringing Machines.....	C. S. Schmidt	30,159
Wringers, Mop		
Y.		
Yards, attachment of, to top-masts.....	S. Hall	28,354
Yarns, manufacture of	F. Vouillon and F. Tavernier.....	27,014
Yarns, spinning, Machinery for	J. E. Crowell.....	28,161
Yarns, spinning, Machinery for	E. Victory.....	28,220
Yarns and Threads, manufacture of.....	S. M. Allen.....	27,877
Yokes, Ox, Fastenings.....	W. N. Lockwood.....	28,384
Yoxes, Ox, Pins for fastening bows in	J. Warner and T. C. Silliman	29,207

Invention or Discovery.	Name of Patentee.	Number.
Z.		
Zinc, Oxide of, Apparatus for manufacturing	I. M. Milbank	27,142

REISSUES, 1860.

Invention or Discovery.	Name of Patentee.	Number.
A.		
Alarm, Burglars	E. Brown	924
Alarm, Burglars	T. A. Requa	964
B.		
Bands, Wrought Iron, contracting the circumference of.	C. L. Crowell and Robt. Smith	887

REPORT
OF THE
COMMISSIONER OF PATENTS
FOR THE YEAR 1860.

UNITED STATES PATENT OFFICE,
January, 1861.

SIR: In compliance with the fourteenth section of the act, entitled
“An act in addition to the act to promote the progress of science and
the useful arts,” approved March 3, 1837, I have the honor to submit
a report of the operations of this office during the year 1860.

No. 1.

Number of applications during the year.....	7,653
Number of patents granted, including designs, reissues, and additional improvements.....	4,819
Number of caveats filed.....	1,084
Number of applications for extension of patents.....	74
Number of patents extended.....	29
Number of patents expired, 31st December, 1860.....	614
Of the patents granted there were—	
To citizens of the United States.....	4,781
To subjects of Great Britain	21
To subjects of the French Empire.....	12
To subjects of other foreign governments.....	5

No. 2.

Statement of moneys received during the year, namely:	
On applications for patents, reissues, additional improvements, extensions, caveats, disclaimers, and appeals	\$240,867 00
For copies, and for recording assignments.....	15,485 59
Total	<u>\$256,352 59</u>

No. 3.

Statement of expenditures from the patent fund during the year, namely:	
For salaries	\$100,685 55
For amount paid under the fifth section of the act of June 25	9,887 15
For contingent expenses.....	60,296 01
For temporary clerks.....	51,497 93
For withdrawals.....	28,960 00
For refunding money paid into the Treasury by mistake.	302 50
For judges in appeal cases	1,075 00
	<u>\$252,704 14</u>

No. 4.

Statement of the condition of the patent fund.

Amount to the credit of the patent fund, 1st January, 1860	\$85,905 62
Amount paid in during the year	256,352 59
Total	<u>\$342,258 21</u>
Deduct expenditures during the year	252,704 14
Which leaves in the Treasury, 1st January, 1861, the sum of.....	<u>\$89,554 07</u>

No. 5.

Table exhibiting the business of the office for twenty-four years, ending December 31, 1860.

Years.	Applica- tions filed.	Caveats filed.	Patents issued.	Cash re- ceived.	Cash ex- pended.
1837.....			435	\$29,289 08	\$33,506 98

1860.....	7,653	1,084	4,819	256,352 59	252,820 80

It will be seen by the foregoing statement of the operations of this office during the year 1860, that under the protection of the laws provided by Congress, deficient as they are in many respects, the inventive genius of our countrymen has been active beyond precedent, and that the business of the office has increased in a corresponding ratio.

Although the patent laws of this country, as revised by the act of July 4, 1836, and still further modified by the acts of March 3, 1837; March 3, 1839; August 29, 1842; May 27, 1848; and August 30, 1852, are believed to embrace the most perfect system of patent jurisprudence known to the world, yet they are far from approaching that standard which experience has shown is necessary to place them beyond reproach. Many of the defects inherent in the law have been so clearly and forcibly set forth by the various able and distinguished gentlemen who have been at the head of the office, that I find nothing to add, in the way of argument, to show the necessity of their correction to the effective administration of the affairs of the office. Were it otherwise, I should find myself relieved of this duty, since it is understood that a bill has already passed one branch of Congress, which, if it shall succeed in the other, will have a remedial effect that will go far to prevent the grant of worthless patents, to the detriment of the country, and to secure the allowance of valid claims as a reward to the meritorious inventor. I can but hope that the bill will pass at

an early day. It has in its main features received the sanction of gentlemen whose legal training and experience lend to their judgment that respect and dignity which are generally the concomitants of, and grace, profound attainments. It meets my own cordial approbation.

There are, however, other imperfections in the existing laws which I believe the pending bill does not propose to cure, and which, as far as my information extends, have not been heretofore the subject of communication to the legislature.

By the seventh and eighth sections of the act of July 4, 1836, an appeal lay from the decision of the Commissioner of Patents refusing a patent, and in interference cases, to a board of examiners, composed of three disinterested persons, who were appointed for that purpose by the Secretary of State; and they, or a majority of them, were empowered, on examination and on consideration of the matter, "to reverse the decision of the Commissioner, either in whole or in part; and their opinion being certified to the Commissioner," he was to "be governed thereby in the further proceedings to be had on such application."

But this board, temporary in its nature, its members being appointed for each occasion, and their services inadequately remunerated, experience proved to be an entire failure; and hence, by the eleventh section of the act of 1839, it was abolished, and the appellate jurisdiction transferred "to the chief justice of the district court of the United States for the District of Columbia." This was a step in advance. It was a decided improvement upon the original tribunal, and gave rise to no complaint, until the year 1850, when Chief Justice Cranch announced to this office that he was unable, by reason of the infirmities of age, to discharge the duties imposed upon him by the acts of Congress. From this period up to the 30th of August, 1852, a defeated party had no remedy from an adverse decision of the Commissioner; and the act of Congress of the latter date, which was designed as a remedy for this state of things, was only partial in its effect, for the right to appeal to the chief justice still remained; its remedial agency consisting only in the provision that appeals might "*also* be made to either of the assistant judges of the circuit court of the District of Columbia." The evils resulting from this condition of affairs were grievous, as might have been expected. In *ex parte* proceedings, a disappointed applicant, who might be disposed to obstruct the ends of justice, could, although conscious of the substantial correctness of the official decision, by appealing to the infirm chief judge, secure to himself the right to manufacture and sell the thing invented during that official's lifetime, if during his lifetime he should be unable, as he was, to discharge the duties imposed on him. Many appeals had been taken to Judge Cranch, before the passage of the remedial act of 1852, by parties aware of his inability to act. Some of the applicants refused to transfer their causes to one of the associate judges. In such cases, where there was no opposing party, the evils resulting were such as have just been portrayed; but when the contest was between two *bona fide* and independent inventions, they were still worse. The appellants were not only permitted to make and vend the article invented with impunity so long as the chief justice should live, and thus secure a monopoly for more than fourteen years if they should finally secure

their patents, but they were enabled to prevent the issuing of patents to the other and successful parties, who were willing and anxious to put the public in immediate possession of the fruits of their genius, which is one of the considerations for the grant of a patent.

Commissioner Hodges was prompt in his energies to meet and crush these great wrongs. He accordingly issued his orders that in all cases where appeals had been taken to the chief justice in cases of interference, the appellants should amend by transferring them to one of the assistant judges; and that all appeals in like cases that should thereafter be brought should be taken to the same officers.

Commissioner Mason was anxious to support his predecessor; but he doubted the competency of the Commissioner of Patents to limit the right of appeal, however strong the necessity. In a case then before him, he said he had every disposition to do this if he had the power. The matter was, therefore, laid before Attorney General Cushing for his advice, who, in pronouncing his opinion, said: "I perceive the inconvenience involved in the fact, that the party against whom the Commissioner has decided, in a case of interference, may, by an appeal to the chief justice, which he by infirmity is unable to hear and determine, purposely delay and obstruct the final decision of the case in favor of the rightful claimant to the patent, and thus injustice be done. But Congress, and Congress alone, has, in my opinion, power to remedy the evil."

I have been thus minute in tracing the working of the several statutes giving the right to an appeal, for the purpose of stating with the more emphasis that the act of 1852, devolving upon the chief justice and either of the associate judges of the circuit court of the District jurisdiction in appeal cases from the adverse decisions of this office, is still in force; that since the demise of Judge Cranch in 1855, we have had a recurrence of the inconvenience resulting from the act, in the inability of one of the associate judges to attend to the duties of his office for about a year; and that a similar contingency may arise at any day, when, of course, such appeals as may have been taken to the disabled judge must await the issue of events, to the injury alike of the public and of individuals.

Another serious objection to the act of 1852, and in which particular it should, in my opinion, be amended, flows from the rate and manner of compensating the judges for their services. By the thirteenth section of the act of the 3d March, 1839, the chief justice was paid annually out of the patent fund, in consideration of the duties therein imposed, the sum of \$100. But this section was repealed by the act of 1852, and the Commissioner of Patents was required to pay to the chief justice, or assistant judges, according as the appeal might be taken to either, the sum of twenty-five dollars, required to be paid by the appellant into the Patent Office by the eleventh section of the act of the 3d of March, 1839.

The reason of this enactment it is now difficult to discover; but the evils resulting from it must, I think, be apparent to every reflecting mind, and are very forcibly stated by the Hon. Secretary of the Interior, in his annual report to the President of the United States for 1857.

“The appellant not only selects the judge who shall try the case, but also pays the fee of twenty-five dollars allowed him. The amount of compensation thus received will depend upon the number of cases brought before him; that number will inevitably be influenced by his course of decision. The judge is thus placed in a position of embarrassment, if not of humiliation, alike to be deplored by himself and the country.”

There is still another point in which the act allowing appeals imperiously calls for amendment. The eleventh section of the act of March 3, 1839, requires the commissioner to “lay before the said judge all the original papers and evidence in the case, together with the grounds of his decision fully set forth in writing, touching all the points involved by the reasons of appeal to which the revision shall be confined.” This “evidence,” most commonly consists of the *records* of the office, the drawings, specifications, and models of patented and rejected applications, which are needed always in the office for the transaction of its current business, and yet this law requires that with every appeal, the commissioner shall transmit to the selected judge that portion of the records appertaining thereto, which, as proceedings are at chambers, means to the residence of the judge. In the meantime, these records are withdrawn from public inspection and instances have occurred, in which applications for patents have been suspended for months, in consequence of the danger of acting upon them in the absence of a portion of the records relating thereto.

Such are the evils incident to the laws of appeal, as they now exist. There is no difficulty in the way of their amendment, and, in my opinion, no time should be lost in applying the proper remedies. Why could not appeals from the adverse decision of the Commissioner of Patents be taken to the Circuit Court of the District of Columbia, instead of to the individual judges? Why could not each judge for the duties thus imposed be allowed an annual compensation of, say \$500, and when a patent cause should be heard, why not require the Circuit Court to sit in the Patent Office, in a room to be provided for that purpose? I confess I can see no objection to an amendment of this nature, and respectfully recommend that such a law be enacted. It would obviate all the defects above explained, and it is confidently believed, would meet with the approbation of the judges.

Previous to the month of December, 1857, it was the practice of the Commissioner to hear appeals in person from the adverse action of the examiners; but it was soon found, from the natural increase of the business of the office, that this was becoming a physical impossibility; and hence was adopted the alternative of deputing temporary boards of examiners, which, in some measure, relieved the Commissioner of the burden thrown upon him. But the plan soon developed its own imperfections. Each board had its own principle of action, and, in many instances, this differed from the rules prescribed by the Commissioner. As a corrective, it was at length determined by Commissioner Holt to establish a permanent board of appeal within the office, whose members, three in number, should be taken from the examining corps, and whose duty it should be to examine all *ex parte* rejected cases, and submit their report and recommendation, as to their final

disposal, to the Commissioner for his approval. This board has now been in existence for over three years, and the wisdom of its creation is a matter placed beyond all doubt. Guided in its principles of action by the doctrines established by the courts, and illustrated by such eminent Commissioners as Mason, Holt, Bishop, and Thomas, whose confidence it has always enjoyed, "the result of its action," as stated by Mr. Holt, in his report for 1858, continues to be "eminently satisfactory," and "to command, it is believed, the entire confidence of the country."

Since its establishment the board of appeals has revised 1,790 cases, 748 of which it has reported for final rejection, while 271 have received its partial action. Of those rejected, only forty-two have been carried up on appeal to the judges of the circuit court of the District. It is confidently believed that no other tribunal of a like nature can exhibit such evidence of public approbation.

Prior to the 1st July, 1860, interferences were declared, examined, and the result reported to the Commissioner, by the separate examiners to whose class they belonged. While the business of the office was comparatively light, and the number of examiners few, there was not much objection to this course; but as the number of applications and examiners increased—the former, however, in a greatly augmented ratio to the latter—it was found to be impossible for the examiners to attend to their current duties in an intelligent manner when they were subject continually to be called off, to devote, in many instances, a week at a time, to the hearing and determination of questions arising between contesting applicants. But this perhaps was not the greatest evil. The examiners had increased in the course of a few years from two in number to twelve; and as each examiner disposed of his own interferences, there were as many different sets of rules and principles established as there were differently constituted minds. The want of harmony, the confusion, in short, resulting from such a state of things, was a source of great complaint, and involved the office practice in a mist so impenetrable that the most acute became discouraged in their search for a clear and well-defined guide to the path they sought. A remedy seemed to be imperative; and as the only resource within his power, Commissioner Thomas deputed one of the most practiced and competent examiners to discharge this duty, whose action, characterized by great industry and ability, it is believed has given eminent satisfaction.

I would suggest that Congress make the designation permanent with reference to this particular service, giving the sanction of positive enactment to a rule eminently successful, if not imperatively required, in the future conduct of the business of the office.

S. T. SHUGERT,
Acting Commissioner of Patents.

Hon. JOHN C. BRECKINRIDGE,
Vice-President United States.

ALPHABETICAL LIST OF PERSONS WHOSE PATENTS FOR INVENTIONS AND DISCOVERIES HAVE EXPIRED DURING THE YEAR 1860. 8

ANNUAL REPORT OF THE

No.	Patentee.	Invention or discovery.	Date.	Class.

ALPHABETICAL LIST OF PERSONS WHOSE PATENTS FOR DESIGNS HAVE EXPIRED DURING THE YEAR 1860.

No.	Patentee.	Design.	Date.
607	Ames, W., assignor to Hartshorne, Ames & Co.	Stove, parlor	November 1, 1853.
612	Ames, W., assignor to Hartshorne, Ames & Co.	Stove, cooking	December 24, 1853.
548	Ball, Thomas	Bust of Daniel Webster	April 19, 1853.
590	Ball, Thomas, assignor to G. W. Nichols	Statue of Daniel Webster	August 9, 1853.
586	Barry, Thomas, assignor to North, Chase & North	Stove, cooking	July 26, 1853.
598	Barth, John H.	Bedstead	October 5, 1853.
587	Bates, Reuben H. N., assignor to North, Chase & North	Range, cooking	July 26, 1853.
553	Beesley, Jacob, assignor to W. P. Cresson & Co.	Stove, cooking	April 19, 1853.
571	Bolton, E., assignor to A. and J. Cox	Stove, cook	June 21, 1853.
550	Chinnock, Charles	Clock-case front	April 19, 1853.
551	Chinnock, Charles	Clock-case front	April 19, 1853.
552	Chinnock, Charles	Clock-case front	April 19, 1853.
577	Cowles, James, assignor to Albert G. Bristol	Register face	June 28, 1853.
569	Davy, John T.	Stove, cook	June 21, 1853.
556	Deitz, Robert E.	Grandoles, candelabra, &c.	April 27, 1853.
581	Dulley, J. J., assignor to Johnson, Cox & Fuller	Stove, cooking	July 19, 1853.
547	Edmonds, Alexander	Cradle	February 22, 1853.
568	Gallagher, A. J., and John J. Baker	Stove, cooking	May 31, 1853.
589	Gerould, A., and J. H. Ward	Sewing bird	August 3, 1853.
596	Gibbs, S. W., assignor to North, Chase & North	Stove	September 6, 1853.
604	Gillies, Theodore I.	Coffins, metallic	October 11, 1853.
597	Gray, William P., assignor to A. and J. Cox	Stove, cooking	September 6, 1853.
556	Hill, Jeremiah	Combs for ladies' hair	April 27, 1853.
565	Holzer, J., assignor to J. G. Abbott and A. Lawrence	Stove, cooking	May 10, 1853.
588	Holzer, Julius, assignor to North, Chase & North	Stove, cooking	August 3, 1853.
599	Holzer, Julius, assignor to North, Chase & North	Stove, cooking	October 5, 1853.
584	Huntley, Hosea H., assignor to Daniel F. Goodhue	Stove	July 26, 1853.
585	Huntley, Hosea H., assignor to Daniel F. Goodhue	Stove, cooking	July 26, 1853.
602	Huntley, Hosea H., assignor to Daniel F. Goodhue	Stove, cooking	October 5, 1853.
560	Jackson, James L.	Grate frame	May 3, 1853.
561	Jackson, James L.	Grate frame	May 3, 1853.
562	Jackson, James L.	Grate frame	May 3, 1853.
563	Jackson, James L.	Grate frame and summer piece	May 3, 1853.
540	Jewett, S. S., and F. H. Root	Stove, cooking	January 25, 1853.
541	Jewett, S. S., and F. H. Root	Stove, wood	January 25, 1853.
542	Jewett, S. S., and F. H. Root	Stove, cooking	January 25, 1853.
543	Lamb, Joseph G., assignor to A. Bradley	Stove, cooking	January 25, 1853.
610	Lane, John	Sewing butterfly	November 8, 1853.
549	Manigle, E. M., and George Phipps	Water cooler	April 19, 1853.
580	Mason, John, assignor to Isaac H. Holden, agent High Street Furnace Company	Stove, cooking	July 19, 1853.
611	Moore, Simon F.	Stove, cooking	November 29, 1853.
593	Palmer, P. A.	Milk stool frame	August 30, 1853.
579	Pierce, Samuel, and J. J. Dulley, assignors to Johnson, Cox & Fuller	Stove, cook	July 12, 1853.
544	Pratt, Joseph, assignor to Bowers, Pratt & Co	Stove, cooking	January 25, 1853.
606	Read, Joseph R., assignor to William W. and C. M. Atkins	Register	October 25, 1853.

605	Richardson, N. P.	Stoves, cooking.	November 1, 1853.
608	Ripley, E., and N. S. Vedder, assignors to G. W. Eddy	Stove, parlor	November 8, 1853.
566	Robinson, Edward F.	Stove, cooking	May 10, 1853.
570	Saby, John, jr., assignor to James K. Griffin.	Stove, cooking	June 21, 1853.
554	Sailor, Samuel H., assignor to C. W. Warnick and Frederick Leibrandt	Stove, cooking	April 19, 1853.
558	Sailor, Samuel H., assignor to C. W. Warnick and F. Leibrandt	Stove, cooking	April 27, 1853.
564	Sailor, Samuel H., assignor to J. G. Abbott and A. Lawrence	Stove, cooking	May 10, 1853.
592	Sailor, S. H., assignor to Abbott & Lawrence.	Stove.	August 23, 1853.
594	Schultz, Frederick, assignor to C. and S. Gilbert	Stove, cook.	August 30, 1853.
583	Smith, Elihu.	Stove, parlor.	July 26, 1853.
557	Smith, G., and H. Brown, assignors to North, Chase & North	Range, portable	April 27, 1853.
595	Smith, G., and H. Brown, assignors to Abbott & Lawrence	Stove, parlor	August 30, 1853.
601	Smith, G., and H. Brown, assignors to North, Chase & North	Stoves	October 5, 1853.
603	Smith, Garretson, and Henry Brown, assignors to C. W. Warnick and F. Leibrandt.	Stoves	October 5, 1853.
559	Smith, John C., assignor to C. W. Warnick and Frederick Leibrandt.	Range, portable	October 5, 1853.
600	Tryday, G. H., assignor to North, Chase & North	Stoves	April 27, 1853.
591	Van Cleve, John W., assignor to James Greer & Co	Stove, cooking	October 5, 1853.
572	Vedder, N. S.	Stove, cook.	August 17, 1853.
609	Vedder, N. S.	Stove, cooking	June 28, 1853.
567	Vose, Samuel D.	Stove, cooking	November 8, 1853.
573	Vose, Samuel D.	Stove, parlor.	May 24, 1853.
574	Vose, Samuel D.	Stove, cooking.	June 28, 1853.
575	Vose, Samuel D.	Stove, cooking.	June 28, 1853.
576	Vose, Samuel D.	Stove, cooking.	June 28, 1853.
626	Vose, Samuel D.	Stove, parlor	June 28, 1853.
627	Vose, Samuel D.	Stove, cooking.	Feb. 14, 1854; antedated Dec. 30, '53.
628	Vose, Samuel D.	Stove, cooking.	Feb. 14, 1854; antedated Dec. 30, '53.
629	Vose, Samuel D.	Stove, cooking.	Feb. 14, 1854; antedated Dec. 30, '53.
613	Wager, James, V. Richmond, and H. Smith	Stove, cooking.	Feb. 14, 1854; antedated Dec. 30, '53.
614	Wager, James, V. Richmond, and H. Smith	Stove, parlor.	December 24, 1853.
546	Waterman, Charles	Stove, coal, cylinder.	December 24, 1853.
578	Waterman, Nathaniel	Sewing bird	February 16, 1853.
		Waffle baker	July 5, 1853.

PATENTEEES OF INVENTIONS AND DESIGNS, 1860.

No.	Name of patentee.	Residence.	Invention or discovery.	Date.
28723	Abbott & Noble. (See Smith & Brown, assignors.)	North Huron, N. Y.	Churn.	June 19, 1860.
27943	Abbott, Harry.	Wakeman, Ohio.	Bolts, heading.	April 17, 1860.
30282	Abbott, Hiram, assignor to self and L. A. Lyon.	St. Louis, Mo.	Quartz crusher and amalgamator.	Oct. 9, 1860.
29212	Acker, Francis B.	Rampo, N. Y.	Hinges, spring.	July 17, 1860.
27091	Acker, Abram, assignor to J. S. Wannaker & Co.	Taliaferro county, Ga.	Planters, cotton seed.	Feb. 14, 1860.

30188	Zollickoffer, William T., assignor to self and Wm. Brown	Shelbyville, Tenn.	Ploughs.	Sept. 25, 1860.

ALPHABETICAL LIST OF PERSONS TO WHOM PATENTS HAVE BEEN REISSUED DURING THE YEAR 1860.

No.	Name of patentee.	Residence.	Invention or discovery.	Date of reissue.	Date of original patent.
946	Adams, Henry B., assignor to Simon B. Hunt.	Brooklyn, N. Y.	Boiler feeder, automatic.	April 24, 1860	Jan. 4, 1859.
926	Aiken, Walter and Jonas B., assignors to Herrick and Jonas B. Aiken, and Herrick & Aiken, assignors to Jonas B. Aiken.	Franklin, N. H.	Knitting machines.	Mar. 13, 1860	Sept. 11, 1855.
992	Albro, James.	Elizabeth, N. J.	Printing oilcloths.	July 3, 1860	} Division, June 7, 1859.
993	Albro, James.	Elizabeth, N. J.	Printing oilcloths.	July 3, 1860	
1017	Aldridge, Hiram.	Michigan City, Ind.	Grain separators, shoe for.	July 31, 1860	
925	Anganar, E. H.	New Orleans, La.	Wharves, piers, &c., mode of staying piles for.	Mar. 6, 1860	May 24, 1859.
1000	Arnall, William M.	Sperryville, Va.	Separators and cleaners, grain.	July 10, 1860	July 12, 1859.
1024	Ashcroft, Edward H.	Boston, Mass.	Gases, apparatus for naphthalizing.	Aug. 14, 1860	May 1, 1860.
1007	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	June 5, 1860.
1008	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	} Division, Dec. 1, 1857; reissued Sept. 27, 1859.
1009	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	
1010	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	} Division, Dec. 1, 1857; reissued Sept. 27, 1859.
1011	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	
1012	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	} Division, June 20, 1854.
1013	Ball, Ephraim.	Canton, Ohio.	Mowing machines.	July 17, 1860	
1071	Bartholomew, Frederick H.	New York, N. Y.	Valve cocks, method of governing the action of.	Nov. 13, 1860	} Division, June 20, 1854.
1072	Bartholomew, Frederick H.	New York, N. Y.	Valve cocks, method of governing the action of.	Nov. 13, 1860	
890	Beckers, Alexander.	New York, N. Y.	Stereoscopic pictures, apparatus for exhibiting.	Jan. 31, 1860	} April 7, 1857.
1035	Berdan, Hiram.	New York, N. Y.	Ovens, bakers'.	Sept. 11, 1860	
1073	Berry, Robert M.	New York, N. Y.	Sewing machines.	Nov. 13, 1860	Oct. 20, 1857.
967	Bertrand, C. E.	Williamsburg, N. Y.	Sugar mould, carriages.	May 29, 1860	Dec. 7, 1858.
1018	Bidwell, Salmon, assignor to New York Car and Steam-boat Gas Company.	New York, N. Y.	Gas regulators.	July 31, 1860	Mar. 30, 1858.
1015	Bleecker, T. B.	New York, N. Y.	Bedstead, folding.	July 24, 1860	Sept. 21, 1858.
1066	Bliss, Jeremy W.	Hartford, Conn.	Door plates.	Oct. 16, 1860	April 17, 1847.
994	Bly, Douglas.	Rochester, N. Y.	Legs, artificial.	July 3, 1860	July 13, 1858.
1070	Bolles, Solomon E.	Matapoisett, Mass.	Stones, machines for raising and transporting.	Nov. 6, 1860	May 17, 1859.
1001	Bonham, J. H., deceased, by A. E. Bonham, admin'r.	Elizabethtown, Ohio.	Seeding machine.	July 10, 1860	April 10, 1855.
1045	Booth, Jonathan L.	Rochester, N. Y.	Separators, grain.	Sept. 25, 1860	Dec. 8, 1857.
954	Bradley, Christopher C., jr.	Syracuse, N. Y.	Iron kettles, cast, grinding the inner surface of.	May 1, 1860	Sept. 20, 1859.
966	Brinckerhoff, Cornelius R.	Batavia, N. Y.	Harvesting machine.	May 22, 1860	Feb. 24, 1857.
891	Bristol, Richard C.	Chicago, Ill.	Valves, slide, for steam engines.	Feb. 7, 1860	May 24, 1859.
953	Brown, Adolph and Felix.	New York, N. Y.	Sugar, loaf, machine for cutting.	May 1, 1860	June 21, 1859.
951	Brown, C. B., assignor to Aultman & Co.	Griggsville, Ill.	Harvesters, grain and grass.	May 1, 1860	Mar. 25, 1856.
952	Brown, C. B., assignor to Aultman & Co.	Griggsville, Ill.	Harvesters, grain and grass.	May 1, 1860	} Division, Dec. 7, 1852.
924	Brown, Ephraim.	Lowell, Mass.	Burglars' alarm.	Mar. 6, 1860	
1036	Brown, George W.	Galesburg, Ill.	Planters, seed.	Sept. 11, 1860	} Division, Feb. 2, 1853, reissued February 16, 1858.
1037	Brown, George W.	Galesburg, Ill.	Planters, seed.	Sept. 11, 1860	
1038	Brown, George W.	Galesburg, Ill.	Planters, seed.	Sept. 11, 1860	
1039	Brown, George W.	Galesburg, Ill.	Planters, seed.	Sept. 11, 1860	} Division, May 8, 1855; reissued Nov. 10, 1857.
1040	Brown, George W.	Galesburg, Ill.	Planters, seed.	Sept. 11, 1860	
1091	Brown, George W.	Galesburg, Ill.	Planters, seed.	Dec. 11, 1860	} Division, May 8, 1855; reissued Nov. 10, 1857.
1092	Brown, George W.	Galesburg, Ill.	Planters, seed.	Dec. 11, 1860	

1093	Brown, George W.	Galesburg, Ill.	Planters, seed.	Dec. 11, 1860	Do.
1094	Brown, George W.	Galesburg, Ill.	Planters, seed.	Dec. 11, 1860	
1095	Brown, George W.	Galesburg, Ill.	Planters, seed.	Dec. 11, 1860	
934	Bryant, Walter, assignor to James W. Reed.	Boston, Mass.	Furnace, air heating.	Mar. 27, 1860	Oct. 24, 1854.
1061	Burger, H. R.	Richmond, Va.	Saws, machine for grinding.	Oct. 16, 1860	Sept. 11, 1860.
1027	Burke, Peter N.	Buffalo, N. Y.	Stoves.	Aug. 21, 1860	July 19, 1859.
915	Burts, Henry, assignor to the Newark Patent Hosiery Company.	Boston, Mass.	Knitting stockings, &c., machine for.	Mar. 6, 1860	Division, Sept. 23, 1843; and extended for seven years after 23d Sept., 1857.
916	Burts, Henry, assignor to the Newark Patent Hosiery Company.	Boston, Mass.	Knitting stockings, &c., machine for.	Mar. 6, 1860	
978	Carr, William S.	New York, N. Y.	Closets, water.	June 12, 1860	Aug. 5, 1856.
1031	Clark, T., assignor to Clark's Patent Steam and Fire Regulator Company.	Bedford, N. Y.	Boilers, steam, safety apparatus for.	Aug. 28, 1860	Aug. 21, 1847.
874	Coes, Aury G.	Worcester, Mass.	Screw wrench.	Jan. 3, 1860	Aug. 16, 1853.
901	Cole, Richard H.	St. Louis, Mo.	Machines, nut making.	Feb. 21, 1860	June 3, 1856.
902	Cole, Richard H.	St. Louis, Mo.	Nut machine.	Feb. 21, 1860	June 3, 1856.
979	Collins, James P.	Troy, N. Y.	Water wheel.	June 12, 1860	Dec. 6, 1859.
1041	Cowling, Henry.	Corpus Christi, Texas.	Ploughs, gang.	Sept. 18, 1860	Nov. 26, 1850.
922	Crocker, D. W.	Deposit, N. Y.	Railroad chairs.	Mar. 6, 1860	Jan. 25, 1859.
921	Crosby, Addison.	Fredonia, N. Y.	Valve for steam engines.	Mar. 6, 1860	Aug. 30, 1859.
1019	Cutting, J. A., and L. H. Bradford.	Boston, Mass.	Photolithography.	July 31, 1860	Mar. 16, 1858.
903	Dick, James M.	Buffalo, N. Y.	Railroad frogs.	Feb. 21, 1860	Aug. 3, 1858.
1032	Dietz, Michael A.	Brooklyn, N. Y.	Lamps.	Sept. 4, 1860	Mar. 8, 1859.
904	Dolph, George C.	West Andover, Ohio.	Mowing machines.	Feb. 21, 1860	Sept. 8, 1857.
1067	Dorsey, Owen.	Dorseyville, Md.	Harvester rakes.	Oct. 23, 1860	Mar. 4, 1856.
980	Drake, Nathaniel.	Newton, N. J.	Corn shellers.	June 12, 1860	April 3, 1860.
937	Dustin, Selah.	Detroit, Mich.	Boilers, steam, low water alarm for.	Mar. 27, 1860	April 26, 1859.
950	Ellis, Thomas, assignor to self and W. A. and A. D. Ellis.	Philadelphia, Pa.	Casting boxes for wheel hubs.	May 1, 1860	Dec. 6, 1859.

1063	Pye, Thomas L.	Roxbury, Mass.	Locks	Oct. 16, 1860	Mar. 6, 1855.
1016	Rains, George W.	New York, N. Y.	Boilers, steam, feed water apparatus for	July 24, 1860	April 28, 1857.
1089	Reed, Jesse, assignor to Catharine M. Hunt	Newburgh, N. Y.	Steering apparatus	Dec. 4, 1860	
920	Rice, Benjamin F., assignor to Charles H. Morgan, L. Whitney, jr., and T. Priest	Marshfield, Mass.	Paper bags, machine for making	Mar. 6, 1860	
905	Robbins, Martin, and Jas. Powell, assignors to Jas. Powell	Clinton, Mass.	Faucets	Feb. 21, 1860	Dec. 21, 1858.
1057	Rogers, John R.	Cincinnati, Ohio	Seeders, percussion	Oct. 9, 1860	Mar. 6, 1860.
918	Roots, P. H.	Sacramento, Wis.	Water wheels	Feb. 28, 1860	Mar. 15, 1859.
906	Sampson, Blaney E., assignor to J. B. Proctor	Connersville, Ind.	Cars, railroad, pole coupling for	Feb. 21, 1860	July 27, 1858.
936	Sanders, J. Milton	Boston, Mass.	Gas, production of illuminating	Mar. 27, 1860	July 27, 1858.
895	Sanford, N. C.	Cincinnati, Ohio	Skates	Feb. 7, 1860	Feb. 20, 1855.
1075	Scarlett, William	Meriden, Conn.	Skates	Nov. 13, 1860	May 29, 1860.
1055	Seely, Samuel J., assignor to C. W. Durant	Aurora, Ill.	Cars, railroad	Oct. 2, 1860	April 24, 1860.
1050	Sexton, B.	New York, N. Y.	Cloth, machinery for drying	Sept. 25, 1860	May 8, 1860.
1003	Seymour, William H., assignor to self, D. S. Morgan, A. Palmer, and S. G. Williams	East Windsor, Conn.	Reaping machines	July 10, 1860	
1004	Seymour, William H., assignor to self, D. S. Morgan, A. Palmer, and S. G. Williams	Brockport, N. Y.	Reaping machines	July 10, 1860	Division, July 8, 1851.
1005	Seymour, William H., assignor to self, D. S. Morgan, A. Palmer, and S. G. Williams	Brockport, N. Y.	Reaping machines	July 10, 1860	
1014	Shaw, Philander	Boston, Mass.	Air engines	July 17, 1860	May 2, 1854.
968	Shaw, William F.	Boston, Mass.	Heating or cooking by gas	May 29, 1860	Nov. 4, 1856.
907	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	Division, Sept. 19, 1845; extended for seven years from and after Sept. 19, 1859.
908	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	
909	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	
910	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	
911	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	
912	Sickels, Frederick E.	New York, N. Y.	Engines, steam	Feb. 21, 1860	
1059	Smith, Horace, and D. B. Wesson	New York, N. Y.	Engines, steam	Feb. 21, 1860	
943	Smith, John Joseph Charles	Springfield, Mass.	Fire-arms, revolving	Oct. 9, 1860	July 5, 1859.
941	Snow, George K.	Philadelphia, Pa.	Matrices, mode of constructing	April 10, 1860	Sept. 20, 1859.
1097	Somes, D. E., assignor to James S. Anderson	Watertown, Mass.	Paper, machine for folding	April 3, 1860	Oct. 15, 1860.
		Biddeford, Me.	Curling provisions	Dec. 11, 1860	Nov. 13, 1860.

Alphabetical list of persons to whom patents have been reissued during the year 1860.

No.	Name of patentee.	Residence.	Invention or discovery.	Date of reissue.	Date of original patent.
1049	Southworth, Albert S.	Boston, Mass.	Cameras, plate holder for.	Sept. 25, 1860	April 10, 1855.
944	Stanley, Henry, assignor to Charles Eddy and Jacob Shaver.	Poultney, Vt.	Stoves, coal	April 10, 1860	January 4, 1845; extended for seven years from and Jan. 4, 1859.
958	Stanley, Henry, assignor to Charles Eddy and Jacob Shaver.	Poultney, Vt.	Stoves, coal	May 8, 1860	January 4, 1845; extended for seven years from and after Jan. 4, 1859; reissued April 10, 1860.
1078	Stanley, Henry, assignor to Charles Eddy and Jacob Shaver.	Troy, N. Y.	Stoves, coal	Nov. 13, 1860	January 4, 1845; extended for seven years from and after Jan. 4, 1859; reissued April 10, 1860; reissued May 8, 1860.
985	Steadman, Thomas S., assignor to W. N. Whiteley, jr.	Murray, N. Y.	Harvesters, clover and grass seed	June 19, 1860	} Division, May 23, 1854. May 25, 1858.
986	Steadman, Thomas S., assignor to W. N. Whiteley, jr.	Murray, N. Y.	Harvesters, clover and grass seed	June 19, 1860	
987	Steadman, Thomas S., assignor to W. N. Whiteley, jr.	Murray, N. Y.	Harvesters, clover and grass seed	June 19, 1860	
1104	St. John, J. A., assignor to D. S. Morgan, assignor to W. H. Seymour, D. S. Morgan, S. G. Williams, and A. Palmer.	Janesville, Wis.	Harvesters, raking attachment for	Dec. 18, 1860	
956	Stimpson, H. H.	Boston, Mass.	Ranges, cooking	May 1, 1860	April 5, 1859.
1042	Stoddard, J. C.	Worcester, Mass.	Hay making machines	Sept. 6, 1860	Dec. 11, 1859.
974	Swartz, Jacob	Buffalo, N. Y.	Harvesters, grain and grass	June 5, 1860	Nov. 14, 1854.
886	Tambling, William H.	Berlin, Wis.	Washing machine	Jan. 17, 1860	Oct. 11, 1859.
1030	Taylor, Alva B., assignor to Henry A. Burr.	New York, N. Y.	Hat bodies, machinery for making	Aug. 21, 1860	Mar. 18, 1856.
957	Titus, S. H., and O. Des Granges.	St. Louis, Mo.	Pavement, cellular iron	May 1, 1860	Oct. 13, 1857.
948	Tompkins, Clark	Troy, N. Y.	Knitting machines	April 24, 1860	Dec. 23, 1856.
963	Tompkins, Clark, and John Johnson.	Troy, N. Y.	Knitting machines	May 15, 1860	Sept. 18, 1855.
928	Towne, Lauriston	Providence, R. I.	Chain machine	Mar. 13, 1860	Oct. 20, 1857.
1051	Travis, Nathan C., Nathan Johnson, and Richard Emerson.	Alton, Ill.	Valve for steam engines, regulator	Sept. 25, 1860	Oct. 11, 1859.
988	Trotter, Jonathan T.	New York, N. Y.	India rubber, vulcanizing	June 19, 1860	Dec. 3, 1859.
1081	Trumbull, Horace	Jersey City, N. J.	Glass, flint, manufacture of	Nov. 20, 1860	July 3, 1860.
1076	Tyler, Samuel W.	Greenwich, N. Y.	Harvesters	Nov. 13, 1860	Jan. 26, 1858.
929	Ulmer, Philip	New York, N. Y.	Bed bottom, spring	Mar. 13, 1860	Oct. 4, 1859.
882	Urmey, Jesse	Wilmington, Del.	Harvesters, grain and grass	Jan. 3, 1860	} Division, July 24, 1855.
883	Urmey, Jesse, assignor to David M. Osborne.	Wilmington, Del.	Harvesters, grain and grass	Jan. 3, 1860	
1100	Van Anden, William	Poughkeepsie, N. Y.	Copying apparatus, portable	Dec. 18, 1860	Sept. 7, 1858.
1006	Van De Mark, Charles	Oaks Corners, N. Y.	Fences, portable, method of uniting the panels of.	July 10, 1860	June 2, 1857.
1052	Van Dyke, Augustus	Greenupsburg, Ky.	Ores, heating	Oct. 2, 1860	April 24, 1860.
1069	Van Steenburgh, Hiram, and Joel Egnor, assignors to themselves and Peter Baurhyte.	Catskill, N. Y.	Hoisting and storing ice, apparatus for	Oct. 23, 1860	Nov. 30, 1858.
930	Wagener, D. S.	Penn Yan, N. Y.	Mills, flouring	Mar. 13, 1860	Sept. 25, 1855.
1086	Wells, Henry A., deceased, Eliza Wells, administratrix of, assignor to Henry A. Burr.	New York, N. Y.	Hat bodies, machinery for making	Dec. 4, 1860	} Division, Apr. 25, 1846; reissued Sept. 30, '56; extended for 7 years from and after April 25, 1860.
1087	Wells, Henry A., deceased, Eliza Wells, administratrix of, assignor to Henry A. Burr.	New York, N. Y.	Hat bodies, manufacturing	Dec. 4, 1860	

900	Westinghouse, George	Schenectady, N. Y.	Horse power, endless chain	Feb. 14, 1860	June 13, 1854; reissued July 10, 1855.
942	Wharton, William, Jr.	Philadelphia, Pa.	Railroads, dispensing with switches on	April 3, 1860	Dec. 13, 1859.
1064	Wheeler, Calvin D.	Bridgeport, Conn.	Needle case and index	Oct. 16, 1860	May 17, 1859.
971	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	June 5, 1860	Feb. 6, 1855.
875	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	Division, Dec. 5, 1854.
876	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	
877	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	
878	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	
879	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	
880	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	Aug. 3, 1858.
881	Wheeler, Cyrenus, Jr.	Poplar Ridge, N. Y.	Harvesters, grain and grass	Jan. 3, 1860	
1043	Wheeler, Eli	Elmira, N. Y.	Cars for railroads, sleeping	Sept. 18, 1860	Jan. 17, 1860.
1028	Wheeler, John W.	Cleveland, Ohio	Water from wells, method of elevating and delivering	Aug. 21, 1860	
896	Whitaker, John T., and Calvin D. Read	St. Charles, Ill.	Reaping and mowing machines	Feb. 14, 1860	Division, Aug. 11, 1857.
897	Whitaker, John T., and Calvin D. Read	St. Charles, Ill.	Reaping and mowing machines	Feb. 14, 1860	
898	Whitaker, John T., and Calvin D. Read	St. Charles, Ill.	Reaping and mowing machines	Feb. 14, 1860	
899	Whitaker, John T., and Calvin D. Read	St. Charles, Ill.	Reaping and mowing machines	Feb. 14, 1860	
965	White, Lewis, assignor to S. S. Putnam & Co.	Hartford, Conn.	Curtain fixtures	May 22, 1860	
1060	Whittemore, Amos	Cambridgeport, Mass.	Nails, horse shoe, machine for making	Oct. 9, 1860	Division, June 2, 1857.
1101	Wickersham, John B.	Brooklyn, N. Y.	Bedstead, folding	Dec. 18, 1860	
1102	Wickersham, John B.	Brooklyn, N. Y.	Bedstead, folding	Dec. 18, 1860	March 6, 1860.
1023	Wight, Henry, assignor to William C. McClallan	Cambridge, Mass.	Shoes, wooden-soled	Aug. 7, 1860	
1082	Wilcox, Stephen, Jr.	Westerly, R. I.	Air engines	Nov. 20, 1860	Division, May 3, 1859.
1083	Wilcox, Stephen, Jr.	Westerly, R. I.	Air engines	Nov. 20, 1860	
1025	Wilhelm, Charles, and Anna C.	Philadelphia, Pa.	Lamp shades	Aug. 14, 1860	May 3, 1859.
984	Williams, Turner, assignor to self and David Heaton, 2d	Providence, R. I.	Window stop	June 12, 1860	
913	Wilson, Allen B., assignor to Wheeler and Wilson Manufacturing Company	Waterbury, Conn.	Stitches by machinery, process of forming	Feb. 28, 1860	Division, Aug. 12, 1851.
914	Wilson, Allen B., assignor to Wheeler and Wilson Manufacturing Company	Waterbury, Conn.	Stitches by machinery, process of forming	Feb. 28, 1860	
964	Wilson, John P., and John F. Thomas, assignors to Wilson Manufacturing Company	Frankfort, N. Y.	Burglar's alarm	May 22, 1860	Feb. 8, 1859.
982	Wyberd, John	New York, N. Y.	Reflector, night light	June 12, 1860	

ALPHABETICAL LIST OF PATENTEES TO WHOM ADDITIONAL IMPROVEMENTS WERE GRANTED DURING THE YEAR 1860.

No.	Names.	Residence.	Invention.	Date of imp't.	Date of original patent.
272	Anderson, Alban.	Lancaster, Ohio	Engines, steam, governor for	Mar. 20, 1860	Aug. 3, 1858.
270	Angamar, E. H.	New Orleans, La.	Wharves, piers, &c., mode of staying piles for ..	Mar. 6, 1860	July 12, 1859; reissued Mar. 6, 1860.
295	Banks, William C.	Como Depot, Miss.	Planters, corn	Sept. 4, 1860	May 1, 1860.
293	Bauder, Michael L.	Cleveland, Ohio	Churn	Aug. 7, 1860	Jan. 19, 1858.
284	Briggs, B. B.	Sharon, Ohio	Tile, drain, apparatus for laying	June 26, 1860	Oct. 4, 1859.
261	Brush, Addison G.	Great Bend, Pa.	Churns, operating	Jan. 10, 1860	June 15, 1858.
274	Cartwright, Robert	Ithaca, N. Y.	Boat propellers, canal	April 3, 1860	July 19, 1859.

Alphabetical list of patentees to whom additional improvements were granted during the year 1860.

No.	Names.	Residence.	Invention.	Date of imp't.	Date of original patent.
307	Chase, Thomas G.	Philadelphia, Pa.	Fabrics incorrodible, rendering.	Dec. 11, 1860	Nov. 9, 1858.
266	Costello, Thomas P.	Buffalo, N. Y.	Skate fastening.	Feb. 28, 1860	Dec. 6, 1859.
271	Cowles, Norman, and Abijah Hulbert.	Edgefield, S. C.	Carriage seats, spring back.	Mar. 13, 1860	Oct. 11, 1859.
282	Dickey, Julius C.	Saratoga, N. Y.	Quartz, machinery for crushing.	June 12, 1860	May 8, 1860.
290	Edson, William F.	Philadelphia, Pa.	Shoe heels, machine for cutting and finishing.	July 24, 1860	Sept. 6, 1859.
265	Ells, Josiah, assignor to James M. Cooper and William S. Lavelly.	Pittsburgh, Pa.	Fire-arms, revolving.	Feb. 21, 1860	Aug. 1, 1854; reissued Sept. 6, 1859.
298	Elmer, D. F.	Haydenville, Mass.	Watch key and guard bar.	Oct. 2, 1860	June 26, 1860.
275	Emerson, James.	Boston, Mass.	Windlasses, ships.	April 3, 1860	Aug. 28, 1855.
268	Evarts, Harry H., assignor to self and P. E. Merrihew.	Chicago, Ill.	Sawing staves from the bolt, machine for.	Mar. 6, 1860	May 17, 1859.
276	Gatchell, H. P., assignor to E. J. Bates.	Ravenna, Ohio.	Pots, coffee.	April 3, 1860	Nov. 22, 1859.
294	Geiger, Albertus.	Dayton, Ohio.	Lamps, vapor.	Aug. 14, 1860	May 29, 1860.
303	Glover, Amos.	Powhatan Point, Ohio.	Corn crushers.	Nov. 20, 1860	June 5, 1860.
277	Gore, John.	Battleboro', Vt., formerly of Fredonia.	Harvester cutters.	April 10, 1860	Feb. 16, 1858.
279	Gregg, Mahlon.	Philadelphia, Pa.	Tenons on spokes, machine for cutting.	May 15, 1860	Feb. 9, 1858.
269	Huston, John.	Ottawa, Ill.	Seeding machines.	Mar. 6, 1860	Jan. 19, 1858.
309	Johnson, Frank G.	Brooklyn, N. Y.	Composition to prevent the depredation of insects	Dec. 18, 1860	March 27, 1860.
299	Johnson, William H.	Richmond, Ark.	Ploughs.	Oct. 2, 1860	Feb. 14, 1860.
296	Jolly, Thomas J.	Olean, Ind.	Hay, machines for loading.	Sept. 4, 1860	June 26, 1860.
285	Jones, Daniel.	Boston, Mass.	Steering apparatus.	June 26, 1860	Feb. 21, 1860.
297	Kingsbury, G. J.	Rochester, N. Y.	Stoves.	Sept. 18, 1860	April 12, 1859.
302	Laidley, Theodore T. S.	United States Army.	Fire-arms, tape primer for.	Oct. 9, 1860	Feb. 15, 1859.
263	Lefebvre, Louis.	New Orleans, La.	Sugar juices, furnaces for evaporating.	Jan. 24, 1860	Nov. 23, 1858.
280	Lyman, Josiah.	Lennox, Mass.	Protractor.	May 15, 1860	May 25, 1858.
300	McEnally, J. B.	Clearfield, Pa.	Paper and letter file.	Oct. 2, 1860	Feb. 28, 1860.
278	Newbury, Frederick D.	Albany, N. Y.	Fire-arms, revolving.	May 1, 1860	June 12, 1855.
291	Overocker, Anthony.	McHenry, Ill.	Huller, clover.	July 24, 1860	July 5, 1859.
301	Parkhurst, George T.	Baltimore, Md.	Lamps.	Oct. 2, 1860	Sept. 13, 1859.
281	Pendleton, Charity.	Galena, Ill.	Washing machine.	May 29, 1860	July 12, 1859.
273	Pond, Joseph F.	Cleveland, Ohio.	Washing machine.	Mar. 27, 1860	Oct. 26, 1858.
264	Quern, Edmond.	New York, N. Y.	Oils, gelatinizing.	Jan. 24, 1860	Aug. 30, 1859.
267	Race, Washburne.	Seneca Falls, N. Y.	Pump packings.	Feb. 28, 1860	Nov. 24, 1857.
262	Richardson, Sylvanus.	Jericho, Vt.	Water wheel.	Jan. 17, 1860	May 17, 1859.
304	Robertson, Henry H.	Kingston, Mo.	Ploughs.	Nov. 27, 1860	July 10, 1860.
308	Sadier, James.	Egremont, Mass.	Thills to axles, coupling for.	Dec. 18, 1860	July 24, 1860.
286	Shrote, John H.	Baltimore, Md.	Cakes, cutting and panning.	June 26, 1860	Oct. 11, 1859.
305	Sims, William.	New York, N. Y.	Refrigerator.	Dec. 4, 1860	Feb. 8, 1859.
287	Smith, Elisha M., assignor to self and Elbridge G. Mayhew.	Indianapolis, Ind.	Moulding machines.	June 26, 1860	Feb. 21, 1860.
288	Tiberi, Joseph.	St. Louis, Mo.	Grates.	July 17, 1860	Sept. 6, 1859.
283	Whitman, Thomas Spurr.	New York, N. Y.	Skates to boots, attaching.	June 19, 1860	Dec. 20, 1859.
306	Wilkinson, Asbury.	Shelbyville, Ind.	Washing machines.	Dec. 4, 1860	Sept. 20, 1859.
292	Winslow, A. P.	Cleveland, Ohio.	Railroad cars, roofs for.	July 31, 1860	Aug. 9, 1859.
289	Yeiser, Frederick.	Indianapolis, Ind.	Altitudes of the sun, instrument for taking.	July 17, 1860	Feb. 8, 1859.

ALPHABETICAL LIST OF PATENTEES WHOSE PATENTS WERE EXTENDED DURING THE YEAR 1860.

Names.	Residence.	Invention.	Date of patent.
Butterworth, Joshua H.....	Indianapolis, Ind.....	Locks, door.....	April 11, 1846.
Carmichael, D., deceased, by E. Carmichael, surviving administratrix, and J. C. Osgood.	Brooklyn, N. Y.....	Dredging machine..	May 30, 1846.
Carey, Daniel, deceased, by his executors, Norman Shelton and Jane Carey.	Clarkson, N. Y.....	Horse power.....	June 27, 1846.
Dutcher, Warren W.....	Millford, Mass.....	Looms.....	June 27, 1846.
Fosket, William.....	Meriden, Conn.....	Hat bodies, machinery for making.....	Jan. 23, 1846.
Garsed, Richard.....	Franklin, Pa.....	Looms for tweeling, operating treadle cams in.....	July 20, 1846.
Granger, R. D.....	Albany, N. Y.....	Stoves, cooking.....	June 13, 1846.
Gwynne, James S.....	New York, N. Y., formerly of Pittsburgh, Pa.	Acids, separating olein and stearic.....	Sept. 3, 1846.
Harvey, Hayward A., administrator of Thomas W. Harvey..	New York, N. Y.....	Screw heads, machine for dressing.....	Aug. 18, 1846.
Harvey, Hayward A., administrator of Thomas W. Harvey..	New York, N. Y.....	Screws, machine for cutting.....	May 30, 1846; reissued Dec. 28, 1858.
House, Royal E.....	Binghamton, N. Y.....	Telegraph, magnetic printing.....	April 18, 1846; reissued Sept. 20, 1859.
Howe, Elias, jr.....	Brooklyn, N. Y.....	Sewing machines.....	Sept. 10, 1846.
Howe, William, deceased, by Joseph Stone, administrator..	Springfield, Mass.....	Bridges, truss.....	Aug. 28, 1846.
Judson, A., and.....	Rochester, N. Y.....	Telegraph bell.....	Oct. 17, 1846; reissued Dec. 26, 1848.
Jackson, E. N., administratrix of T. D. Jackson, deceased..	New York, N. Y.....	Telegraph, bell.....	Oct. 17, 1846; reissued Dec. 26, 1848.
Judson, Alfred, and.....	Rochester, N. Y.....	Stoves.....	Sept. 5, 1846.
Elizabeth N. Jackson, adm'x of Timothy D. Jackson, dec'd..	New York, N. Y.....	Ploughs.....	May 2, 1846.
Latrobe, John H. B.....	Baltimore, Md.....	Netting machine.....	June 27, 1846.

DESCRIPTIONS AND CLAIMS OF PATENTS

ISSUED IN THE YEAR 1860.

ILLUSTRATED WITH ENGRAVINGS.

No. 26,642.—ALEXANDER ANABLE, of Middlesex, N. Y.—*Improvement in Corn Planters*.—Patent dated January 3, 1860.—The cog wheel *d* has its teeth cut away on two or more planes, forming intermediate spaces *d*¹, so that the cam *c*, together with the shaft *a* and dropping rollers, is allowed to fly back by the action of the spring *b*, whenever one of the intermediate spaces *d*¹ comes opposite the cam. By this means a continuous rotary motion can be given to the cog wheel *d*, and still the dropping rollers are caused to receive seed and discharge the same at the proper intervals.

Claim.—The arrangement of the cog wheel *d*, with intermediate spaces *d*¹, in combination with the cam *c*, spring *b*, and seed-dropping rollers *E*, substantially as and for the purposes specified.

No. 26,643.—JOSEPH K. ANDREWS, of Antrim, Ohio.—*Improved Combination of Seat and Cane*.—Patent dated January 3, 1860.—*a* represents the legs into which the main body of the cane divides when used as a seat; *b*, the three pointed centre pin upon which the legs of the cane work; *c*, the canvas seat; *d*, a pin fastened from the centre of the under side of the seat; *e*, the hollow cap, which gives a finish to the cane, and conceals the seat; *f*, the ferrule; and *g*, a spring for holding fast the ferrule.

Claim.—The cane as constructed for the purposes of a cane and seat, operating as described and for the purposes set forth.

No. 26,644.—JOHN A. BASSETT, of Salem, Mass.—*Improvement in the Manufacture of Hydro-carbon Gas*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The continuous manufacture of an illuminating gas, by carrying the hydrogen and the vapor of a liquid hydro-carbon, formed in the manner described, through a retort which is intensely heated, for the purpose of producing a permanent illuminating gas.

No. 26,645.—JAMES E. BOYLE, of Brooklyn, N. Y.—*Improvement in Valves for Water Closets*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with the body of the cock provided with the discharge pipe or nozzle, and having its cylindrical bore surrounded by an induction pipe, forming a surrounding chamber, with apertures in its bore for the admission of water, as described, three piston valves on a movable stem, one above the discharge pipe and the other two below it, and bearing the relations to the series of apertures from the cylindrical bore in which they work to the surrounding supply chamber, substantially such as described.

No. 26,646.—PAUL BOYNTON, of Canton, N. Y.—*Improvement in Magazine Fire Arms*.—Patent dated January 3, 1860.—*G* is a sliding charger placed at the base and between the barrel and tube *D*, having a hole corresponding to the size of the bore of the barrel, and likewise to the hole at the base of the powder magazine *F*, and also to an outlet in the cam *B* into the chamber *H*.

The inventor says: I *claim* the sliding charger *G*, when used for the purpose and in the manner substantially as specified.

I also claim the method of loading by revolving the barrel and magazine, substantially as described in the specifications.

And also the method of loading by means of the charger *G*, and magazines *F* and *D*, in combination, substantially as described and set forth in the specifications.

No. 26,647.—THOMAS H. BURLEY, of New York, N. Y.—*Improvement in Dovetailing Machines*.—Patent dated January 3, 1860.—The front edge of the bed E is recessed at *h*, in order to allow the cutters *c* to pass through and permit the bed to support the work while acted on by the cutters *c*.

Claim.—The employment or use of the rotary cutter *c*, in connection with the rising and falling tilting bed E, arranged substantially as and for the purpose set forth.

No. 29,648.—LEVI BURNELL, of Milwaukee, Wis.—*Improvement in Match Safes*.—Patent dated January 3, 1860.—This invention consists in constructing the safe with an opening or slot *a*, extending the whole height of the box, and a slot *c* extending the whole width of its bottom. It also consists in using in connection with the slot or opening of the box an inclined bottom *b*, to facilitate the removal of the matches when a few only remain on the bottom.

The inventor says: I *claim* a match box or receptacle provided with a slot or opening at one side and at its bottom, substantially as and for the purpose set forth.

I also claim the inclined bottom *b*, with the slots in the side and bottom of the box, for the purpose specified.

No. 26,649.—JAMES CALKINS, of Hudson, N. Y.—*Improvement in the Manufacture of Hydro-carbon Gas*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching to the eduction pipe of hydro-carbon blowers, chambers, pipes flues, or for the purpose of heating the air after it leaves the blower or air chamber, and before it comes in contact with the hydro-carbon employed to produce light or heat.

No. 26,650.—J. THEODORE CHABOT, of Buffalo, N. Y.—*Improvement in Ship's Tillers*.—Patent dated January 3, 1860.—This invention consists in arranging the blocks Y Y with the sliding block *t t* upon the forward end of straight tiller E moving upon the square surface P.

Claim.—The surface P of the forward end of straight tiller E, in form representing a parallelogram, in combination with the sliding block *t t* and its friction rollers, double block Y Y, lower and upper straps *c c*, with centre bolts located at the centre of tiller E, as described in the specification.

No. 26,651.—DAVID P. CHAMBERLIN, of Hudson, Mich.—*Improvement in Fruit Gatherers*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the lower jaw at right angles with the shaft, or nearly so, in combination with the open work throat and the hose pipe for delivering the fruit at each cutting of the stem, so that the eye of the operator can constantly inspect the fruit at the side of and through the open throat; the whole being arranged and operating in the manner and for the purpose substantially as set forth.

No. 26,652.—JAMES S. COLVIN, of Pittsburgh, Pa.—*Improvement in Steering Apparatus*.—Patent dated January 3, 1860.—G is the axle, composed of two double conical enlargements *a a*, with deep grooves in their surface, running in a continuous channel from end to end of the axle, in which grooves is wound the tiller rope J. This rope is passed round the drum or axle G a number of times, and each end is carried to opposite sides of the vessel and passed over pulley wheels N N, and from these they are secured to the end of the tiller B.

Claim.—The employment of an axle or drum that is provided with four grooved cones, arranged as shown, for the purpose specified.

No. 26,653.—SUMNER COOPER, of Windsor, Conn.—*Improvement in Window Sash Supporters*.—Patent dated January 3, 1860.—The lock operating in connection with the balance consists of two sliding bolts *g g*, operated by the double-headed lever H and spring *k* conjointly. The knob *i* of the lever projects from the casing, and by raising it one of the heads of the lever acting against a projection *l*, on the upper bolt *g*, presses it back so that its head falls within the case, and it becomes inoperative. The spring *k*, which is arranged to vibrate against the point or fulcrum *m*, by having its upper end thrown back, presses forward the lower bolt by the projection *l* and throws it into action.

The inventor says: I *claim* my improved reversible-acting lock and balance, consisting of the double-headed knob lever H, double inclined bolt *g g*, oscillating spring *k*, working against the stops *l l* and *m*, strap *f*, and spring drum D, arranged and operating substantially in the manner and for the purpose shown and described.

I also claim the employment of the metallic strap or band *f*, acting by its flexibility and elasticity to aid in starting the sash, and requiring no grooving of the sash, in combination with the drum D and coiled spring *e*, substantially as and for the purposes herein set forth.

No. 26,654.—MATTHEW CRIDGE, of Pittsburgh, Pa.—*Improvement in Steam Valves*.—Patent dated January 3, 1860.—This invention consists in an arrangement of a revolving cylindrical or cup valve A, which is capable of cutting off the steam at any point in the stroke of an engine, being connected with the governor D of the engine, so that the point of cut off is controlled by the action of the said governor, whereby the charge of steam admitted into the cylinder is regulated or varied so as to meet any changes in the resistance or load of the engine, or any variation in the steam pressure.

Claim.—Providing in such an arrangement (*i. e.*, of a revolving and ascending and descending cup valve) the valve A and its seat B, with port openings having inclined edges 5 6 7 8, so that the steam is cut off by them variably and controlled by the governor, substantially in the manner and for the purposes set forth.

No. 26,655.—HENRY F. CROMWELL, of Cynthiana, Ky.—*Improvement in Ploughs*.—Patent dated January 3, 1860.—The slots *a* and *c* render the wing C adjustable in respect to the bar and sheath E, and the bolts D D¹ and nuts *d d*¹ serve to secure it firmly in any position desired. The flange A, sheath E, and wing C all have the form of a cylindrical segment, so that the wing in every position of adjustment possesses a firm and solid bearing upon the bar and upon the sheath.

Claim.—The described arrangement of the cylindrically curved frame timber or sheath E, wing C, flange A, bar B, slots *a* and *c*, and bolts D and D¹, the whole being constructed and combined in the manner and for the purposes set forth.

No. 26,656.—FRANCIS DAVIS, of Lima, Ohio.—*Improvement in Cultivators*.—Patent dated January 3, 1860.—D E are the shovels secured fast on the legs C C¹. From the left edge of the shovel E a guard *c* projects upward. A wing *d* is formed on the left edge of the shovel E. At the top of the shovel E, and on the leg C¹ of the plough, a curved conductor G is arranged, which forms a continuation of the right curved edge of the shovel E, and may be set more or less to the right by means of a slot *e*.

Claim.—The arrangement of the plough A B C C¹, shovel D or H, shovel E, guard *c*, and slotted adjustable conductor G, all in the manner and for the purposes set forth.

No. 26,657.—PERRY DAVIS, of Providence, R. I.—*Improvement in the Construction of Boats*. Patent dated January 3, 1860.—This invention consists in combining an India rubber spring *a a* with suitable gear wheels for operating the wheels which become propellers when the boat is in the water. The gearing is so arranged as to be disengaged when the boat is on land, and the wheels are used as carriage wheels.

The inventor says: I *claim*, first, the combination with the boat A¹ of spur wheels G G, fixed to the hubs of wheels C C, wheels J J, adjustable shafts F F, cranks G¹ G¹, and compressed India rubber springs, substantially in the manner and for the purposes stated.

Second. I claim the universal joint or gimbal for attaching the bow of the boat to the front axletree, when the same is so constructed as to combine with it an India rubber spring, substantially in the manner and for the purposes set forth.

No. 26,658.—HORACE H. DAY, of New York, N. Y.—*Improvement in the Manufacture of Shirred Goods*.—Patent dated January 3, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the compound process described for manufacturing elastic shirred goods, consisting substantially of the two following operations, viz: the coating of the covering cloth with a thin coating of India rubber or the vulcanizable compound of India rubber and sulphur, or its equivalent, without the use of a solvent preliminary to the application of the said coated cloth to strands, strips, or sheets of India rubber, and then the application of the cloth so coated to strands, strips, or sheets of rubber in an extended state.

I also claim, in combination with the compound process above specified, the vulcanization of the fabric produced thereby, the whole invention thus far specified being a compound process composed of three operations.

I also claim, in combination with the said first compound process, subjecting the compound fabric, prior to vulcanization and while in an extended state, to the action of fluted rollers or crimping it, substantially as set forth, this part of my invention being a compound process, or a combination of three operations.

No. 26,659.—LEGER DISS, of Oriskany, N. Y.—*Improved Lock*.—Patent dated January 3, 1860.—This invention consists in having an arm or lug L on the barrel, through which the handle passes, fitting into a cavity *c* in the bolt B, so that the bolt is moved by turning the handle. The bolt has a spring S¹ to cause it to fly back after the handle is released, and is held in place by a stop A catching against a projection *h* at the lower end of it. This stop is divided into two sections *a b*, the back one, into which the point of the key goes,

projecting over the front one, so as to allow the turning of the key to move both sections down.

Claim.—The sectional stop A, overlapping as described, in combination with the bolt B, spring S¹, and the parts connected therewith, the arrangement and construction being substantially as set forth.

No. 26,660.—H. W. ELLIOTT and GEORGE S. CONKLING, of Goshen, N. Y.—*Improvement in Railroad Switches*.—Patent dated January 3, 1860.—This invention consists in operating the switch rails so as to shift them to the right or left and bring them in a line with the main track by the levers J J¹, situated under the cow catcher of the engine, which levers extend back and are operated by the engineer.

The inventors say: We *claim*, first, the combination of the levers H H¹, with their pins c c¹ c², movable cross-tie E, jointed switch rail F¹, and sleeper G, with recesses a a, arranged substantially in the manner as and for the purposes described.

Second. We claim the levers J J¹, having inclined and oblique guides g g arranged in such a manner under the locomotive as to be under the control of the engineer, and so as to operate the switch in the manner described and represented.

No. 26,661.—JAMES R. ENDER, of Trenton, La.—*Improvement in Inkstands*.—Patent dated January 3, 1860.—This invention consists in the employment or use of a hollow cone C, formed of two equal longitudinal parts b b, attached in an inverted position by hinges or joints c c to the under side of a cap B, which screws into the top of the inkstand, each part of the cone having a spring d d bearing against it.

Claim.—The hollow inverted cone C, formed of two longitudinal parts b b, connected to the cap B by joints c c, and acted upon by the springs d d, substantially as and for the purpose set forth.

No. 26,662.—SETH FLETCHER and JOHN P. PIKE, of Bloomfield, Maine.—*Improvement in Corn Shellers*.—Patent dated January 3, 1860.—The corn being dropped into the hopper, it is carried by the rotation of the shelling wheel around with it, until the cob strikes against the guard r, when it is discharged upward, entirely cleaned from the corn, the shelled corn falling beneath the machine.

Claim.—The combination and arrangement with the loosely hung presser plate i, and revolving shelling wheel h, of the follower plate l, with its springs m, hollow wheel shaft F, and centrally arranged regulating screw o, for operation, in relation to each other and unitedly, essentially as specified.

No. 26,663.—GEORGE E. B. FRENCH, of Washington, District of Columbia.—*Improvement in Apparatus for Medical Topical Applications*.—Patent dated January 3, 1860.—This invention consists in making and constructing garments of India rubber, gutta percha, or other suitable material of a double thickness, so that hot, tepid, or cold water or other fluid, or hot or cold air, can and may be introduced therein, by means of the pressure of water or inflation of air, and keeping up any even or required temperature by the use of tubes attached thereto, and of the application thereof to the whole or to any part of the human body for sanitary or other purposes.

Claim.—The described adaptation of garments, &c., to the human body, constructed of India rubber, gutta percha, or other suitable material, for the purposes set forth, and keeping up an even or required temperature, by the use of tubes introduced therein, and forming a part thereof, or any device substantially the same.

No. 26,664.—MATTHEW CRIDGE and SAMUEL WADSWORTH, of Pittsburgh, Pennsylvania.—*Improvement in Steam Engines*.—Patent dated January 3, 1860.—This invention consists in an improved arrangement of keeping the steam port-surfaces of the side pipe and of the cylinder in proper steam tight contact in such a manner that the expansion and contraction of the cylinder and side pipe, caused by variations in their temperature, have no influence thereon.

The inventors say: We *claim* the arrangement of a set screw or its equivalent, passing through the centre of the trunnion and butting against a transverse bar H, at a point which is in one plane (or nearly so) with the port or valve surfaces a a b b, of the cylinder and side pipe, in the manner substantially as described and for the purpose set forth.

We also claim the arrangement of the pins i i, or other means for the support of the side pipe F, in such a manner that the points of abutment are also in one plane (or nearly so) with the port or valve surfaces of the cylinder and side pipe, substantially as described and for the purposes fully set forth.

No. 26,665.—ARTHUR FOLSOM, of Boston, Massachusetts.—*Improvement in Tubular Submarine Tunnels*.—Patent dated January 3, 1860.—This invention consists of square cast iron tubes of the size of the required passage and of such lengths as may be conveniently

handled. The ends of these are so arranged that they can be joined together beneath the water and form of themselves a water-tight joint.

Claim.—Constructing a submarine roadway or tunnel in the manner described, that is to say, of sections of metal tubes connected as set forth, to form continuous portions, which portions are attached to each other substantially in the manner described.

No. 26,666.—SAMUEL GANTZ, of Beaver Creek, Md.—*Improved Invalid's Bedstead.*—Patent dated January 3, 1860.—This invention consists of a new arrangement of suspension canvas, and also in an arrangement for lowering the mattress instead of elevating the patient.

Claim.—The described new arrangement of canvas and mattress, the latter being lowered while the former remains at rest, as described, for the purpose set forth.

No. 26,667.—JAMES GARDETTE and HENRY RANCE, of New Orleans, La.—*Improvement in Apparatus for forming Vapor for Medical Purposes.*—Patent dated January 3, 1860.—Liquid being poured into the reservoir D, and the cock F opened, it flows down the tube E, and through tube E¹, and fills the arms J; the parts are then rotated very swiftly, and the centrifugal action discharges the liquid through the orifices d of the arms J, and as it is thrown off it is struck by the plates P, and flies off in the form of fine mist, which soon charges the air of the entire apartment.

Claim.—The reduction of liquids into mist or vapor, at any degree of temperature without evaporation, by means of a centrifugal pump, or its equivalent, projecting fine jets of the liquid against disks set at any angle, substantially as described, so that the liquid may be respired with the atmosphere.

No. 26,668.—HEMAN GARDINER, of New York, N. Y.—*Improvement in Springs for Carriages and Railroad Cars.*—Patent dated January 3, 1860.—This invention consists in arranging and combining a coiled or scroll steel spring A upon a cylinder B, with semi-elliptical springs H H placed in recesses on the periphery of such cylinder.

Claim.—Combining and arranging the coiled spring or blade A with the loose auxiliary semi-elliptical springs H H, upon and around the central cylinder having upon its periphery the recesses to receive the loose springs; the whole operating together in the manner and for the purposes described.

No. 26,669.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in the Manufacture of India Rubber Belting.*—Patent dated January 3, 1860.—The claim explains the nature of this invention.

Claim.—The improvement described in the manufacture of machine beltings or bandings, composed either wholly or in part of India rubber or gutta percha, which consists in partially heating the same by placing them in contact with heated rolls or hollow cylinders, or in other suitable modes, previous to their being vulcanized, substantially in the manner and for the purposes described.

No. 26,670.—JOHN GROSS, of Decatur, Ill.—*Improvement in Corn Planters.*—Patent dated January 3, 1860.—This invention consists in adjusting the position of the dropping device, independently of the gearing and driving wheel, so that the operator may be enabled to drop the corn at the exact place in the furrows.

The inventor says: I *claim*, in combination with the revolving shaft of a corn planter, having seed cells in its circumference, the slide h and levers p k, for raising and disconnecting said shaft from the driving wheels, substantially in the manner and for the purpose described.

I also claim, in combination with the lifting devices b, p, and k, the adjusting of the position of the seed cells in the revolving shaft F, by hand, to make them drop the grain at exact points independently of and without turning either of the gearing and driving wheels, viz: by means of an index or hand v secured to said shaft F, substantially in the manner and for the purpose described, and said shaft at the same time detached from the axle or driving wheel, as set forth.

No. 26,671.—WILLIAM C. HABBERTON, of Mount Carmel, Ill.—*Improved Apparatus for Stuffing Horse Collars.*—Patent dated January 3, 1860.—This invention consists in the use of a clasp H and taper pin in combination with the collar block B, for the purpose of holding the collar upon the block while the lower curved or throat portion is stuffed. It also consists in the combination of a lever arrangement with the stuffing rod G, provided with one or more stops.

The inventor says: I *claim*, first, the clasp and taper pin, in combination with the collar block, substantially as and for the purposes set forth.

Second. The combination of the adjustable lever arrangement with the stuffing rod and collar block, substantially as and for the purposes set forth.

Third. The use, in combination with a collar box and stuffing rod, of an adjustable bending and shaping machine, constructed and operating substantially as described in the manner and for the purpose set forth.

No. 26,672.—ISAAC HALLOWAY, of New York, N. Y.—*Improvement in Axle Boxes for Vehicles*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, an axle box arranged with chilled cast iron balls D to fit into a cap C, together with a groove *a* in the axle A, an oil hole *r* in the centre of the cap C, and quadrant recesses *g* in the inside of the sleeve, substantially as and for the purposes specified.

Second. The arrangement of the recess *d* in the flange *e*, in the front end of the axle A, substantially as described, for the purpose of facilitating the operation of putting in and taking out the balls D.

No. 26,673.—JOSEPH HARRIS, of Dorchester, Mass.—*Improvement in Railroad Car Axle Boxes*.—Patent dated January 3, 1860.—This invention consists in so forming a box that it will have a bearing at the front and back to receive the end thrust of the axle.

Claim.—In combination with an axle box in which the journal of the axle is inserted endwise, and in which the soft metal packing may also be inserted from the end, the front and back bearings *d c*, and flanges *h k*, for receiving the end thrust of the axle, and thus protecting the soft metal packing, substantially as described.

No. 26,674.—B. B. HAWSE, of Morrisville, Vt.—*Improved Clothes Dryer*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Two perforated hubs H H¹ movable upon the shaft, in combination with the swivel pulley P upon the shaft head cord C, performing the double function of expanding and elevating the frame, and the self-acting ratchet eccentric R, as applied to clothes dryers.

No. 26,675.—RANDALL HOLDEN, of New York, N. Y.—*Improved Spring Bed Bottom*.—Patent dated January 3, 1860.—This invention consists of a spring of rubber webbing attached at one end between plates of metal *a b*, and in turn to the rail of a bedstead, and having at the other end an extension link G, by which it is attached and made adjustable, and also by pins *c d* in the slats by which they are kept from swerving.

Claim.—The extension link G and pins *c d*, combined with the spring D and fastening *e b a*, substantially as and for the purposes set forth.

No. 26,676.—N. HOMES, of Laona, N. Y.—*Improvement in Straw Cutters*.—Patent dated January 3, 1860.—This invention consists in combining, with an ordinary reciprocating knife C and gate B, a leger knife E, arranged to operate conjointly with the upper knife for the purpose of facilitating the cutting operation.

Claim.—The combination of the two knives C E, arranged to operate substantially as and for the purpose set forth.

No. 26,677.—WILLIAM H. HORSTMANN, of Brooklyn, N. Y.—*Improvement in Laying Telegraph Cable*.—Patent dated January 3, 1860.—The improvement consists in properly suspending the cable after it is paid out from the vessel by floats *q*, and then allowing it gradually to settle to the bottom or bed of the ocean in curves or festoons.

Claim.—The floats *q*, attached and arranged substantially as described, for the purpose of a graduated action, substantially as and for the purposes set forth.

No. 26,678.—JEAN JAKES HUBER, of Geneva, Switzerland.—*Improvement in Jewelry*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming articles of jewelry of a series of movable and adjustable pieces, so that the aspect and appearance of the said articles may be changed at pleasure, substantially as set forth.

No. 26,679.—L. T. HULBERT, of Painesville, Ohio.—*Improved Double Seaming Machine*.—Patent dated January 3, 1860.—The operation is as follows: The proper former and rotary head being secured on the mandrel and shaft, and their centres brought in direct line by moving the frame C horizontally and securing it by the set screw, the standard R is then adjusted by means of the slot and bolt, so that the edges of the former and head come together sufficiently to admit them between the article to be seamed, the rotating head is then brought down on the seam by turning the pressure screw.

The inventor says: I *claim*, first, the rotating head, operated in the manner and by the

means described, so as to produce a lateral pressure on the seam, in combination with the mode of adjusting the direct line arrangement referred to by means of the shank, socket, and set screw, as described, together with the adjustable standard R, substantially as specified and for the purposes set forth.

Second. I claim the former A¹, with its raised or convex border C¹, and tapering edge B¹, in combination with the rotary head D¹, having its edge constructed as shown, to be used in conjunction with the arrangement in my first claim, for the purpose of double-seaming raised or convex work, as described and shown.

No. 26,680.—ENOCH JACOBS, of Cincinnati, Ohio.—*Improvement in Truss Frames for Bridges*.—Patent dated January 3, 1860.—This invention consists in the combination of double angle iron rails with certain arrangements of vertical and oblique braces and tie rods.

Claim.—The combination of the upper and lower double angle iron rails with the tubular braces and tie rods and the oblique interlocking braces, to form a bridge truss, all arranged and operating in the manner substantially as set forth.

No. 26,681.—BARTON H. JENKS and WILLIAM A. TUTTLE, of Philadelphia, Pa.—*Improvement in Cotton Gins*.—Patent dated January 3, 1860.—This invention consists in surrounding a portion of the ginning cylinder with smooth metallic bands or ribs so placed as to be concentric, or nearly so, with their outer surface, and just above the line of the points of the gin roller.

Claim.—The arrangement of stationary metallic bands A A A A A, &c., arranged concentric with and around either the whole or a part of the circumference of the gin cylinder, and just above the end of the gin teeth, in the manner and for the purpose specified.

No. 26,682.—HENRY R. KINNEY, of Portsmouth, Ohio.—*Improvement in Cultivators*.—Patent dated January 3, 1860.—This invention consists in the arrangement of the furrow ploughs D D D¹, adjusting devices E E E, and the frame A B C, so that the ploughs may be all adjusted and shall all stand on the same side of a row of plants and one row of them turn up a furrow slice close along the side of the young plants, and another receive the same and return it in a loose or friable condition back against the roots of the plants and the other plough up the remaining portion of the soil between the two rows of plants.

Claim.—The arrangement of the furrow ploughs D D D¹, adjusting devices E E E, and frame A B C, in the manner set forth.

No. 26,683.—HENRY F. KNODERER and LEVI F. KNODERER, of Chillicothe, Ohio.—*Composition for Preventing the Incrustation of Steam Boilers*.—Patent dated January 3, 1860.—The claim will explain the nature of this invention.

Claim.—The application of a compound of alum, glue, wood ashes, and wheat bran, prepared and applied as specified, to prevent the deposition and accumulation of lime, known as "lime scale," upon the interior of steam boilers and pipes, of whatever kind, as specified and substantially as set forth.

No. 26,684.—THOMAS LEAVITT, of Malden, Mass.—*Improved Second Anchor Shackle*.—Patent dated January 3, 1860.—This invention consists in so constructing the roller as to have it connected with the other parts of the apparatus when the shackle is slipped upon or taken from the chain and not separable from it.

Claim.—As an improvement in the apparatus herein before referred to as patented, the combination of the roll *a* or *b* with the cheek *c*, substantially in the manner described for the specified purpose.

No. 26,685.—URI LEE, of Burlington, Mich.—*Composition for Mixing with Paints*.—Patent dated January 3, 1860.—The inventor says: I put two gallons of rain or soft water in a vessel, and add six ounces of sal soda and three ounces of borax, and heat the water until the sal soda and borax are dissolved, and then add one gallon of linseed oil, and stir the whole until it is thoroughly compounded.

Claim.—The described composition or paint vehicle mixed or compounded in the proportions stated.

No. 26,686.—MOSES W. LESTER and MAX HJORTSBERG, of Chicago, Ill.—*Improvement in Apparatus for Heating and Ventilating Buildings*.—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

Claim.—The arrangement of the ventilating pipes F, extending down to the bottom of the furnace drum B and chimney flue A, in combination with a furnace which is constructed with a central fire-box K P L, radiating drum H H G G I I O, and air-circulating and heating

chamber extending up beyond the ventilating drum, in the manner and for the purposes described.

No. 26,687.—AUSTIN LEYDEN, of Atlanta, Ga.—*Improvement in Sewing Machines*.—Patent dated January 3, 1860.—The spool holder I, with the spool in it, is put in its place in the bed H through an opening *m m*, in the bed plate A. The position occupied by the spool holder is such that the axis of the spool I is parallel with the face of the bed plate and oblique to the direction of the feed motion.

Claim.—The spool holder, constructed and applied in combination with the bed H, substantially as described.

No. 26,688.—GEORGE B. LEWIS, of Moreau Station, N. Y.—*Improved Milk Pan Rack*.—Patent dated January 3, 1860.—This invention consists in having two frames provided with horizontal parallel slats and connected by a joint at their upper ends, said frames being provided with horizontal slatted platforms, and also with adjustable side frames.

Claim.—The use of the frames A A, connected by joints *c*, in connection with the supplemental frames E E, and with or without the horizontal frames B C D, substantially as and for the purpose set forth.

No. 26,689.—FRANCIS C. LOWTHROP, of Trenton, N. J.—*Improvement in Pivot Bearings*.—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

Claim.—Interposing between the plate C of a turntable, swing bridge, or other like object, and the step or foundation plate A a pivot B, constructed and arranged in respect to the plates substantially as described, so as to form a centre on which the object connected to the plate C may roll and balance itself, and so as to present, in contact with the plate A, a self-lubricating surface.

No. 26,690.—GEORGE B. MARKHAM, of Mead's Mills, Mich.—*Improvement in Seeding Machines*.—Patent dated January 3, 1860.—This invention consists in the arrangement of parts whereby the driving wheel can be thrown out of gear instantaneously and at the same time the machine be allowed to back without effect on, or injury to the dropping mechanism.

The inventor says: I *claim*, first, the arrangement of the sleeve E, on the axle of the driving wheel, with the ratchet wheel *e* and cams *d*, or their equivalents, in combination with the pawl *g*, dog *i*, and pointed rod *j*, or its equivalent, substantially in the manner and for the purpose specified.

Second. The arrangement of the reversible seat E, with two bottoms *l l'*, substantially as described, in combination with the hand lever K, and seed slide J, whereby the dropper is enabled to face the rows in whatever direction the machine may run, and to adjust the seat to a convenient position for operating the lever.

No. 26,691.—J. H. MASKER, of Newark, N. J.—*Improved Machine for Turning Hat Blocks*.—Patent dated January 3, 1860.—This invention consists in the adaptation of machinery to varying the length, size, and shape of blocks from the pattern block from which they are turned or formed by the same machine as will, if desired, produce an exact duplicate of the pattern.

Claim.—The oscillating frame B and the devices for altering the shape of the block from that of the pattern, constructed, combined, and arranged substantially as set forth.

No. 26,692.—JOHN McMANNUS, of New York, N. Y.—*Improvement in the Ventilation of Hats*.—Patent dated January 3, 1860.—The claim and engraving will explain the nature of this invention.

Claim.—A ventilating piece composed of India rubber or gutta percha, having a smooth surface, next the head, and grooves or openings next the brim, and firm enough not to crush or close up said openings, as represented and for the purpose set forth.

No. 26,693.—JOHN B. McMUNN, of Port Jervis, N. Y.—*Improved Lubricating Compound*.—Patent dated January 3, 1860.—The alkaline base of this compound is a solution of the carbonate of potassa in water, which unites and forms combinations with oleine and stearine, the proximate acid principles of animal and vegetable oils and fats and tallow, and with cerine, the acid principle of beeswax and myrtle wax.

The inventor says: I *claim* the composition made of the proximate acid principles of the herein-named ingredients and alkali, by combining them together in the manner and proportions as substantially described and for the purposes set forth.

And I also claim the rejection of the underlye in the process, and the substitution and mixture of water with the residual mass, to reduce it to a thinner consistency for practical use, substantially as described and set forth.

No. 26,694.—A. P. MERRILL, JR., of Natchez, Miss.—*Improvement in Hoop Locks*.—Patent dated January 3, 1860.—This invention consists in attaching to one end of the hoop a metal plate B provided with a slot *b*, and having a hook C secured to it in such a relative position with the slot that the opposite end A of the hoop which is perforated may be passed through the plate, and either of its perforations fitted on the hook.

Claim.—The plates B provided with a slot *b* attached to one end A¹ of the hoop, the hook C projecting from the inner side of the plate in connection with the perforated end A of the hoop, substantially as and for the purpose set forth.

No. 26,695.—F. MISNER and P. A. MISNER, of Fox, Ill.—*Improvement in Cultivators*.—Patent dated January 3, 1860.—The cultivator passes over the row of corn; the shovels of one wing standing on one side of the row and those of the other wing on the other side, consequently both sides of the row of corn are worked at one operation.

Claim.—The arrangement of the beam *h*, wings *m*, transverse pieces E O, handles H, slotted standard 2, legs *u*, shovel R, castings C B, brace rods *b*, forked strap G, forked rod *x*, and transverse timber *s*, the whole being constructed and used together in the manner and for the purpose described.

No. 26,696.—ALBERT MOREHOUSE, of Farmer, N. Y.—*Improvement in Gates of Water Wheels*.—Patent dated January 3, 1860.—This invention consists in combining with the spout 5, through which the water is laid on the wheel, and with each other, two gates 6, and 7, set in a position angular to each other and to the direction of the stream.

Claim.—The combination, with the spout 5 and with each other, of the gates 6 and 7, inclined and arranged as described for the purposes set forth.

No. 26,697.—CAMPBELL MORFIT, of New York, N. Y.—*Improvement in a Substitute for Wax*.—Patent dated January 3, 1860.—This compound is composed of Japan vegetable wax and paraffine, mixed by fusion in a double bottom kettle, heated by a current of steam and then cast into blocks.

Claim.—The use of Japan vegetable wax, in combination with paraffine, in the manner and for the purposes set forth.

No. 26,698.—JOHN MURPHY, of New York, N. Y.—*Improvement in treating Waste and Inferior Gums*.—Patent dated January 3, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the process described for manufacturing the vulcanizable compounds of vulcanizable gums, consisting of the following operations, viz:

First. The manufacture of hard stock of the vulcanizable gum by blending it with sulphur, or its equivalent, and vulcanizing the compound until it is hard.

Second. The reduction of the hard stock to powder.

Third. The formation of a compound of the ground stock and raw gum by blending the two together.

Fourth. The vulcanization of the compound formed by the preceding operation, the several operations constituting the process being effected in the order stated.

No. 26,699.—THOMAS NEWCOMB and G. W. BYRD, of Smith's Fork, Tenn.—*Improvement in Cotton Cultivators*.—Patent dated January 3, 1860.—The beam A, which is similar to the beam of a plough, is supported by two wheels B behind and two fore wheels C C, and it is furnished with two handles D, whereby the course of the machine may be governed in the same manner as that of ploughs.

Claim.—The arrangement and combination, with the ploughs G G, of the central beam A, double-acting hoe F, cog pinions *c d*, crank *g*, rock shaft *i*, and pitman *h*, all in the manner set forth for the purpose specified.

No. 26,700.—DANIEL NICHOLS, of Onarga, Ill.—*Improvement in Corn Planters*.—Patent dated January 3, 1860.—To the front end of the runners D and right before their centres are secured the rolling cutters F, which serve to clear the track; the guards G are attached to the side of the runners; the metal strips I are secured to the rear end of the runners.

Claim.—The arrangement of the rolling cutters F, guards G, and metal strips I, in combination with the runners D, which are hinged to the frame A, substantially in the manner and for the purpose specified.

No. 26,701.—SEPTIMUS NORRIS, of Philadelphia, Pa.—*Improvement in Steam Boilers*.—Patent dated January 3, 1860.—D is the removable water wall, which consists of a box fitting closely to the bottom and sides of the fire chamber A and connected to the water space G in

the crown of the boiler by means of the circulating pipes *b*, and communicating with the water grates *c* at the rear ends of the latter.

Claim.—The employment of the removable water wall *D* fitting closely to the bottom and sides of the fire chamber, substantially in the manner described for the purposes set forth.

No. 26,702.—M. OBERMILLER, of Tiffin, Ohio.—*Improvement in Railroad Car Brakes.*—Patent dated January 3, 1860.—This invention consists in a combination of levers, which, upon the engine being reversed, act upon the rubbers and stop the train, being held in their position by a spring detent *f*, and are released simultaneously throughout the train by pulling a cord.

Claim.—The combination of the spring detent *f* with levers *a* *E* and *H*, projection *h* on draw bar rod *b* and spring *c*, substantially as and for the purposes set forth.

No. 26,703.—EDWARD PATRIE, of Livingston, N. Y.—*Composition for Soap.*—Patent dated January 3, 1860.—This compound is composed of spirits of wine, spirits of turpentine, and hartshorn, mixed with gum camphor and indigo. In forty-eight pounds of boiling water are dissolved twenty-four parts of common soap, and while at the boiling point three ounces of the above described solution is added to it.

Claim.—The composition of matter, together with the process for making the same, substantially as the same is set forth in the specification.

No. 26,704.—NELSON PECK, of Wilmington, N. Y.—*Improvement in Road Scrapers.*—Patent dated January 3, 1860.—When the bar *F* is in position, the head or stock *A* is elevated above the earth, the machine being supported by the wheels *E E*. When the bar *F* has its back end in the lower recess *e*, the scoop *C* rests on the earth, and as the machine is drawn along the earth will be scraped up in front of the scoop.

Claim.—Attaching the wheels *E E* to the head or stock *A*, to which the scoop *C* is secured, substantially as shown, so that the same may be adjusted to admit of the raising and lowering of the head or stock, for the purpose set forth.

No. 26,705.—WALTER PECK, of Rockford, Ill.—*Improvement in Pumps.*—Patent dated January 3, 1860.—In the bottom plate *m* of the cylinder *A* is formed a valve opening, furnished with an ordinary flap valve *k*, opening upward. In the bottom plate *h* of the hollow piston *A*² is another valve opening, furnished with another and similar valve *f*; *i* is an annular flange, to prevent the bottom of the hollow piston *A*² from coming down upon the lower valve *k* and injuring it.

Claim.—The construction or arrangement of the valves *c e f* and *k* within the cylinder *A*, in combination with the hollow piston *A*² and hollow piston rod *B*, the whole constructed to operate as specified.

No. 26,706.—GEORGE W. PENNISTON, of North Vernon, Ind.—*Improvement in Cotton Presses.* Patent dated January 3, 1860.—To fill this press the doors *E* and *C*¹ are opened and the press box filled with cotton, and the doors are closed and fastened. The windlass is then worked to draw down the toggle levers until the screw *I* operates the bar *F*⁴ and releases the door *F*¹, when the bale is ready to receive its hoops.

The inventor says: I claim the clevis *F*², constructed substantially as described, in combination with the bar *F*¹ and key *F*³, for locking and releasing the doors of the press box, as specified.

I claim fastening the block *I*¹ to the rockshaft *H*², so as to relieve it of some of the pressure in working the press, as set forth.

No. 26,707.—LOUIS PLANER, of New York, N. Y.—*Improvement in Grooved Pulleys.*—Patent dated January 3, 1860.—Each side of the groove *b* is furnished with sharp pointed ridges *c*, running tangentially from the outer circumference of the pulley to the circle forming the bottom of the groove, and in a direction opposite to the direction in which the pulley has to operate, and they are so arranged that those on one side of the groove stand exactly opposite to the spaces between those on the other side, and may be slightly curved.

Claim.—A grooved pulley *A*, arranged with tangential ridges *c* on the sides of the groove *b*, as and for the purpose specified.

No. 26,708.—IRA C. PRATT, of Morton, Ill.—*Improvement in Draining and Pipe-laying Machines.*—Patent dated January 3, 1860.—The shaft *D* is adjustable vertically by means of the lever *C*, in such manner that the foot of the cutter or shaft *D* and mole point *H* may be adjusted at any desired depth in the ground. The mole *I* is made with a shank *K* and flange *k*; in said flange *k*, is a slot *K*¹, which is adapted to receive the screw *l*, by means of which the pipe *I* may be secured in such manner as to be drawn within the ground.

The inventor says: I *claim* pivoting the mole point on the adjustable cutter D, for allowing lateral motion in said point and the mole attached thereto, substantially as described.

I also claim the screw *l*, or its equivalent, in combination with the mole I K K K¹, for securing the pipe in such a manner that it may be drawn within the perforation made by the mole I, substantially as described.

No. 26,709.—C. L. PYRON and ROBERT BRUCE, of Manchester, Tenn.—*Improvement in Machinery for Changing Motion*.—Patent dated January 3, 1860.—This invention consists in an arrangement of loose and fixed spur wheels D D¹ G G¹ upon parallel shafts B with a segmental rack E, from which rack projects out a suitable distance a lever or working beam K, so that by elevating and depressing said beam, or vibrating it, a continuous rotary motion will be transmitted to the shafts carrying the spurred gearing.

Claim.—The combination of segmental rack E with lever or beam K, in combination with clutch wheels G G¹ and spur wheels D D¹, arranged and operating in the manner and for the purposes set forth.

No. 26,710.—THADDEUS S. SCOVILLE, of New York, N. Y.—*Improved Clothes Frame*.—Patent dated January 3, 1860.—The arms B B may be secured to any kind of support or standard A. At suitable positions on the standard A the plates C C are secured by means of screws or bolts. These hinge plates C C are set at an angle of forty-five degrees, so that the arms B B may be moved to both a horizontal and vertical position between them and the sides of the support.

Claim.—The hinge plates C C and bolts D D, arranged in combination with the support A and arms B B, substantially in the manner and for the purposes specified.

No. 26,711.—FREDERICK SCHUTTE, of Philadelphia, Pa.—*Improved Vegetable Cutter*.—Patent dated January 3, 1860.—This invention consists of a box or hopper C, having an inclined plane *n*, and being arranged and rendered adjustable on a frame A, in respect to a revolving cutting wheel C, so that the slices cut from the vegetable, &c., may, by the said wheel, be varied in thickness at pleasure.

Claim.—The box or hopper C, having an inclined plane *n*, and being arranged and rendered adjustable on the frame A, in respect to the cutting wheel C, as and for the purpose set forth.

No. 26,712.—PHILANDER SHAW, of Boston, Mass.—*Improvement in Heels for Boots and Shoes*.—Patent dated January 3, 1860.—The claim and engravings will explain the nature of this invention.

The inventor says: I *claim* the heel described as being made of compressed wood, which is first filled with resinous or oily or other equivalent matter, for the purpose set forth.

I also claim the holding band *c*, arranged to be fixed upon and removed from the sole, in combination with the metallic plate *b* and heel *a*, substantially as set forth.

No. 26,713.—JOSEPH SINGER, of Cleveland, Ohio.—*Improved Hose Coupling*.—Patent dated January 3, 1860.—This device consists of a ring of metal D secured around the male part of the coupling by screws, and diametrically opposite to each other and proceeding out beyond the face of this half of the coupling are lugs or arms E E, to the ends of which are pivoted eccentric levers F F, the longer arms of which are connected together by a semi-circular bar or strip G, having a lug or finger piece *d* projecting from its crown, by which the levers are raised in separating the coupling.

Claim.—The adjustable ring D, arms E E, and eccentric levers F F, in combination with the semi-circular strip G, all applied and operating in the manner and for the purposes set forth.

No. 26,714.—JOSEPH W. STICKLER, of Orange, N. J.—*Improved Vegetable Cutter*.—Patent dated January 3, 1860.

The inventor says: I construct an oblong box of wood or metal A, and across this, at the top, I place a series of thin knives *b* an inch apart, and immediately under these I place one or more similar knives lengthwise, as at *c*. A cover *d* is hinged upon the side of the box, and this has upon its under surface projecting blocks, which should nearly fill the spaces between the knives *b*.

Claim.—The series of cutting knives, in combination with the projecting blocks upon the cover, arranged in the manner and for the purposes substantially as described.

No. 26,715.—NELSON P. STRATTON, of Waltham, Mass.—*Improvement in Watches*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement wherein the main ratchet wheel C is disposed between the main gear wheel and the barrel, and made to serve as a head to the barrel and to support the wind-

ing arbor and its spring click, as described, the maintaining power spring being arranged between the gear and ratchet, as specified.

No. 26,716.—CHARLES D. SUTTON, of Kensico, N. Y.—*Improved Calipers*.—Patent dated January 3, 1860.—In using these calipers, the arm 7 is first turned out of the way, to give an opportunity to apply the instrument in taking the measurement of the article. The arms 1 and 2 having been adjusted in the usual manner to the size of the article, are then secured in position by the set screw 16, and on removing the instrument the radius may be read off by folding the graduated arc over upon one of the arms.

Claim.—The combination of the arms 1 and 2 with the spring 11 and 10 and the folding arm 7, substantially as and for the purposes set forth.

No. 26,717.—JOHN SUTTON, of New York, N. Y.—*Improvement in Apparatus for Evaporating*.—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* so applying a steam coil, or other heater, in combination with an evaporating vessel, that it may be independent of the vessel in its action, and may float in and rise or fall with the surface of the liquid in the vessel, substantially as and for the purpose described.

I also claim the employment, in combination with a so applied heater, of means of elevating it wholly above and depressing it wholly below the surface of the liquid as may be desired, substantially as and for the purposes specified.

No. 26,718.—J. V. TAYLOR, of Dixon, Ill.—*Improvement in Ploughs*.—Patent dated January 3, 1860.—This invention relates to a shield attachment for ploughs, so applied and arranged as to protect young growing plants, preventing them from being injured by the ploughs and the earth cast up during the process of cultivation.

Claim.—The combination with a cultivator plough of a shield E, when said shield in its transverse section presents a cima reversa or wave shape, and is perforated and suspended at the side of the cultivator by means of springs a H, and an adjustable clip G, substantially as and for the purposes set forth.

No. 26,719.—WILLIAM D. TITUS, of Brooklyn, N. Y.—*Improvement in Medicated Pads*.—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

Claim.—Filling the pads A A¹ of a belt or girdle with the compound, proportioned and applied in the manner and for the purpose substantially as described and shown in the drawings.

No. 26,720.—JONATHAN T. TROTTER, of New York, N. Y.—*Improvement in Finishing Felt Rubber Goods*.—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

Claim.—The method of finishing or fixing the felt-like coating of powdered flock, ground cork, or other similar fibrous material, upon the surface of a previously water-proofed fabric, by means of a roller partially submerged in a solution of, or solvent of any vulcanizable gum, so that as the submerged parts of the roller are raised from the bath it will deliver the solution or solvent upon the flocked surface of the fabric in an even and uniform sheet to fix the flock into the surface of the fabric smoothly and uniformly together to give it a cloth-like textile appearance.

No. 26,721.—S. T. TROWBRIDGE, of Decatur, Ill.—*Improvement in Canes for Physicians*.—Patent dated January 3, 1860.—This invention consists in having the cane hollow or formed of a tube closed at its bottom, and having a semi-tube B attached to the knob or handle, said semi-tube fitting within the cane and allowed to pass freely in and out of it, and forming a receptacle for vials containing medicine.

Claim.—A physician's cane, constructed with a semi-tubular vial receptacle, substantially as and for the purpose set forth.

No. 26,722.—JAMES TUCKER, of Washington, D. C.—*Improved Stopper for Chain Cables*.—Patent dated January 3, 1860.—This invention consists of a grooved stock or base B, with a scored pawl E, and guiding staple or ring L, to guide the chain into the groove in the stock.

Claim.—The guiding staple or ring, in combination with the grooved stock and scored pawl, arranged to operate substantially as described.

No. 26,723.—RICHARD VOSE, of New York, N. Y.—*Improvement in Car Springs*.—Patent dated January 3, 1860.—This invention consists in the manner of placing and securing the layers of felt and the layers of rubber within cast-iron rings, the interior surfaces of which

are grooved and shaped so as to secure the various layers and give them the required bearings suitable for a spring, and yet not too much to compress or restrain the action of the rubber.

Claim.—Making the metallic ring or circle with a central groove for the purpose of securing the felt firmly in its place, when combined with the India rubber disks; that is to say, in the combination of the centrally grooved ring or circle with the layers of felt and rubber, arranged and operating together as described.

No. 26,724.—SAMUEL WETHERED, of Baltimore, Md.—*Improvement in Hot Air Furnaces.*—Patent dated January 3, 1860.—The claim and engraving explain the nature of this invention.

Claim.—The combination of the inclined fire-box, side cold air doors or registers and auxiliary side draft and cleansing passages, with a furnace constructed with a series of hollow arches, which form a zig-zag flame passage from the fire-box to the chimney flue and communicate by branch tubes with a hot-air reservoir, all in the manner and for the purposes set forth.

No. 26,725.—JOHN C. WILKINS, of Fox Chase, Pa.—*Improved Cabbage Cutter.*—Patent dated January 3, 1860.—The heads or material to be cut up are placed in the horizontal feed trough B, and fed up toward the cutter D, which is caused to rotate rapidly by turning the handle F of the crank E.

Claim.—The movable holder blocks C¹, and securing keys e, in combination with the adjustable radiating knives f, rotary face plate D, and horizontal hopper B, the whole constructed to operate as and for the purpose set forth.

No. 26,726.—HENRY WILVERTH, of Caseyville, Ky.—*Improvement in Coal Excavating Machines.*—Patent dated January 3, 1860.—This invention consists in giving to the rotary cutter head a fourfold motion so that a long and deep trench can be made before it becomes necessary to move the machine, and in an arrangement of the cutters in relation to the cutter head and to the rods which support the same, whereby the trench is made wide enough to admit said head together with the rods.

The inventor says: I *claim*, first, the arrangement and combination of the frames A B C, together with the toothed racks b, and shafts c, or their equivalents, and with the screw shaft h, arms E, cutter head D, and toothed arc c¹, or its equivalent, substantially in the manner and for the purpose specified.

Second. The cutters h¹, arranged substantially as described, in combination with the disks a¹, springs j¹, and pivots i¹, or their equivalents, for the purpose set forth.

No. 26,727.—JAMES YOUNG, of Boston, Mass.—*Improved Pen Rack.*—Patent dated January 3, 1860.—This invention consists in placing in the base of the rack one or more drawers for holding pens, wafers, and stamps.

Claim.—The described pen rack with a drawer B in the base A, substantially as described.

No. 26,728.—GEORGE FREDERICK ZIMMAN, of Philadelphia, Pa.—*Improved Ironing Table.* Patent dated January 3, 1860.—The parts are so arranged that the ironing board can be readily adjusted and firmly sustained at any required angle of inclination with one end free, as well as in a horizontal position upon its supporting frame.

Claim.—The combined arrangement of the ironing board B with the self-adjusting tie N, upon a supporting frame adapted thereto, so as to operate together in the manner and for the purposes set forth and described.

No. 26,729.—JOHN V. S. ADRIANCE and JOSEPH W. CLARK, of Buffalo, N. Y., assignors to J. V. S. ADRIANCE and BENJAMIN G. KELLY, of said Buffalo.—*Improved Refrigerator.*—Patent dated January 3, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The combination of a refrigerator, constructed in the manner set forth, with a provision chamber, when said provision chamber is provided with double glass walls or sides, with an air space between said walls, the two being so arranged and constructed that the provisions within will be exposed to view, while a current of cold air from the ice-box is being constantly circulated through the provision chamber, substantially as specified.

No. 26,730.—WILLIAM C. ALLISON, of Philadelphia, Pa., assignor to himself and JOHN MURPHY, of said Philadelphia.—*Improvement in City Railroad Cars.*—Patent dated January 3, 1860.—This invention consists in illuminating city railroad cars, by placing on that portion of the roof which overhangs the driver's platform an arched reflector H, having a plate or glass in front and a lamp inside, so that the rays of light may be directed by the reflector through the windows of the car to the interior of the same.

Claim.—The arched reflector H, its plate of glass H, and the lamp G, when arranged on

and adapted to the overhanging portion D of the roof, in respect to the window *f*, and the other windows of the car, substantially as and for the purpose set forth.

No. 26,731.—**SOLOMON N. CARVALHO**, of Baltimore, Md., assignor to Himself and **L. K. BOWEN**.—*Apparatus for Superheating Steam*.—Patent dated January 3, 1860.—This invention consists in passing a continuous supply of ordinary steam from the boiler through a cast-iron retort containing equal parts of the black proto-oxyde of iron and iron turnings, the retort being placed either in the furnace of the boiler or in a separate furnace.

The inventor says: I *claim*, first, subjecting steam, while undergoing the superheating process, to the action of the metals named, as and for the purposes set forth.

Second. I claim the arrangement of the pipes, the valves, and the retort, or its equivalent, for conveying from, heating, and returning to the boiler, or its connecting steam dome, the steam, substantially as described.

No. 26,732.—**L. R. DREYSEL**, of St. Louis, Mo., assignor to himself and **JAMES E. BLYTHE**, of said St. Louis.—*Improvement in Ruling Machines*.—Patent dated January 3, 1860.—This invention consists in applying the holder D to the holder B, by means of the two links *a* and *b*, which are attached to each other by means of a working joint, and which are also attached to the beam A and holder D by means of working joints.

Claim.—The application of the penholder D to the penholder B, substantially in the manner described for the purpose specified.

No. 26,733.—**THOMAS FRY**, of Brooklyn, N. Y., and **CHARLES A. SEELEY**, of New York, N. Y.—*Mode of backing up Pictures on Glass*.—Patent dated January 3, 1860.—The claim explains the nature of this invention.

Claim.—The process of using wax, stearine, spermaceti, or other substances or compositions substantially the same, for the purpose of backing up, and as a medium of color for the chemotype and other pictures or designs on glass.

No. 26,734.—**THEODORE P. GOULD**, of Niagara Falls, N. Y., assignor to **STEPHEN V. R. WATSON**, of Buffalo, N. Y.—*Improvement in Breech Loading Fire Arms*.—Patent dated January 3, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the relative arrangement of the powder magazine A, the ball magazine C, and the sliding breech D, for the purposes of a breech loading gun, substantially as set forth.

I claim so arranging the valve R, in relation to the barrel B and stock G, that when the barrel is unscrewed in the act of loading, the said valve will open automatically, and when the barrel is turned back to its place the said barrel will close automatically and fit tightly over the mouth of the tube, thus preventing all danger of igniting the powder in the magazine by the discharge of the gun, substantially as described.

No. 26,735.—**JOHN S. GRAY**, of Hartford, Conn., assignor to himself and **DAVID LYMAN**, of Middlefield, Conn.—*Improvement in Washing Machines*.—Patent dated January 3, 1860.—This invention consists in securing a roller arrangement to a washing machine in an adjustable and detachable manner, so that it may be entirely removed from the machine without removing any fastenings, or so that it may remain attached to the machine and be turned over out of the way, while the washing is performed.

Claim.—The combination of the rollers C C with the turning frame B, having proper forked or slitted projections to secure the roller frame to the tub or box, when arranged and operating substantially in the manner and for the purpose described.

No. 26,736.—**JAMES A. HAMER**, of Reading, Pa., assignor to himself and **NORRIS MARIS**, of Kimberton, Pa.—*Improvement in Brick Moulds*.—Patent dated January 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the interposition of vulcanized rubber, or its equivalent, between the ends and sides of the mould, substantially as and for the purposes set forth.

Second. The combination and arrangement of the cams *ff*, levers or arms E E, inclines *a*, and grooves *b*, with the sides and ends of the mould, substantially as and for the purposes set forth.

Third. The secondary cams *g g*, in combination with the outer division pieces of the mould, as and for the purposes set forth.

No. 26,737.—**PETER HINDS**, of Cedar Run, Pa., assignor to himself and **W. VAN NAME**, of said Cedar Run.—*Improvement in Cant Hooks*.—Patent dated January 3, 1860.—This invention consists in attaching the hook to the handle in such a manner that the hook and handle may be used when required in the ordinary way, and when the hook is not designed

for use; the latter being capable of being so adjusted as to be out of the way, and the handle used as an ordinary lever.

Claim.—Attaching or connecting the hook C to the handle A, by means of the socket D, the hook being provided with the curve *a* at one end, and the ledges *c* at its centre, substantially as shown, to admit of the two adjustments of the hook, for the purpose specified.

No. 26,738.—THOMAS E. HUNT, of Louisville, Ky., assignor to HUNT, BRAWNER & CO., of said Louisville.—*Improvement in Grinding Mills.*—Patent dated January 3, 1860.—This invention relates to the combination of two annular spring cushions, and their arrangement with reference to the revolving upper portion of the mill, so as to give it an elastic or yielding action in relation to the stationary part.

Claim.—The combination of spring *o o* with the cutting blades M, in the manner and for the purpose substantially as set forth.

No. 26,739.—FRANKLIN W. WILLARD, of New York, N. Y., assignor to E. G. ALLEN, of Boston, Mass.—*Improvement in Coal Retorts.*—Patent dated January 3, 1860.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim*, first, the construction of coal oil retorts with internal false or extra heads at either end of the retort, and held at proper distances from the head proper by means of stays or studs, as described, the intervening space between each of the false heads and the end of the retort being filled with clay or other non-conducting material, substantially in the manner and for the purposes specified.

Second. The use of the circular plate *r* hung upon the false head *p*, and operating as described.

No. 26,740.—MARCUS A. WINHAM, of San Juan, Cal., assignor to I. B. Low and F. SMITH, of said San Juan.—*Improvement in Valve Chests for Hydraulic Mining.*—Patent dated January 3, 1860.—This invention consists of a box constructed of wrought or cast iron, the front being pierced with two holes *a a*, of six inches diameter, provided with projecting nozzles, to which flexible hose of canvas or India rubber are to be attached.

Claim.—The arrangement for controlling by means of a chest or distributor, provided with suitable gates, valves or stopcocks for the purpose of cutting off the water employed in hydraulic mining, substantially in the manner as described and set forth in the specification.

No. 26,741.—JOHN WRIGHT, of Sheffield, England, assignor to JAMES CHESTERMAN, of said Sheffield.—*Improvement in Tempering Steel.*—Patent dated January 3, 1860; patented in England October 17, 1857.—The claim and engravings explain the nature of this invention.

Claim.—Preparing strips of steel for hardening and tempering by drawing the same through a metal or fire-clay tube, heated in a furnace, constructed and arranged to operate substantially in the manner and for the purpose set forth.

No. 26,742.—HENRY H. BEACH, of Philadelphia, Pa.—*Improvement in Grain Winnowers.* Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The arrangement of such a shoe when the steps thereof are made movable in such relation to the fan that the grain passes from the first step at a point from which its gravity would cause it to fall in advance of the fan, and where it is exposed to the greatest strength of the blast, in the manner and for the purpose set forth.

No. 26,743.—LEVI A. BEARDSLAY, of South Edmeston, N. Y.—*Improvement in Hop Frames.*—Patent dated January 10, 1860.—The sliding box K consists of two side plates with rollers, which bear upon the side of the strips G G, so as to facilitate their motion, and to lessen the friction. The box is also furnished with rollers, which are rotated by a lever or crank, and upon which the chains attached to the yokes are wound in tightening the wires.

Claim.—The employment of the frame holder composed of a sliding box K, with a windlass or roller to tighten the wire, and a vertical bed or strip G to guide or support the box K, substantially as and for the purpose shown and described.

No. 26,744.—JAMES B. BLACKSLEE and S. S. MIDDLEBROOK, of Newtown, Conn.—*Improvement in Machinery for Felting Hat Bodies.*—Patent dated January 10, 1860.—This invention consists in so combining, moving, and arranging two endless platforms or aprons, in relation one to the other, that when a number of hat bodies are placed between the said platforms, they (the hat bodies) shall receive a pressing rotary motion, which is also progressive, whereby they become properly felted.

Claim.—The combination of the endless rotating platforms *b* and *b*¹, when the same are ar-

ranged so as to move in opposite directions and at varying speeds, in the manner and for the purpose as herein fully set forth.

No. 26,745.—THOMAS BOARD and C. N. AUSTIN, of Jackson Court House, Va.—*Improved Mortising Tool*.—Patent dated January 10, 1860.—This invention relates to an improvement in the combined auger and chisel tool for forming rectangular holes or mortises at a single operation.

Claim.—The combination of the auger C and hollow chisel G, with the screw shaft A, nut D, bars E E H H, and I I J J, arranged substantially as and for the purpose set forth.

No. 26,746.—R. B. BROWN, of Cambridge, Vt.—*Improved Sawing Machine*.—Patent dated January 10, 1860.—This invention consists in a novel way of operating the log carriage in connection with a double edged saw, whereby the saw is made to cut during both movements of the carriage.

The inventor says: I *claim*, first, operating the carriage G by means of the pawls G¹ H connected with the adjusting lever I, and actuated from the saw sash B through the medium of the link h, arm g, rockshaft M, levers L J, and rod K, substantially as shown and described.

Second. The wheels j j, when attached to the yielding bar N, and arranged to operate as described, for the purpose of keeping the work from the saw as it is cut from the log.

No. 26,747.—JOEL BRYANT, of Brooklyn, N. Y.—*Improvement in Journal Boxes*.—Patent dated January 10, 1860.—The inventor says: My axle or journal boxes may be made of any desirable size or number of rollers R, so set within the said boxes as to rest and roll on the central base B, without coming in contact with the axles or journals X, on which the journal boxes are set.

Claim.—The construction and use of friction roller journal boxes, when made with a central base B, substantially as described.

No. 26,748.—JAMES BULLOCK, of Baltimore, Md.—*Improvement in Horse Collars*.—Patent dated January 10, 1860.—This invention consists in making the supporting part of horse collars of duck cloth and with leather bearings for the irons of the harness. The duck cloth is made into a sack, and stuffed with fine straw, and then sewed upon the rim or leather portion of the collar.

Claim.—A horse collar having its shoulder and neck-relieving portion A A made throughout of duck cloth, and without a side seam, and mounted with leather B C, and otherwise constructed after the method described for the purpose described.

No. 26,749.—LYSANDER BUTTON and ROBERT BLAKE, of Waterford, N. Y.—*Improved Hose Coupling*.—Patent dated January 10, 1860.—M and F are the male and female parts of the coupling; A the nozzle, upon the end of which is a screw thread taking into a thread, upon the inside of part M, and the joint is set up simply by turning the nozzle.

Claim.—Combining with the male and female parts M and F, a closing pipe having an end-wise motion through one of said parts, substantially as set forth.

No. 26,750.—NATHAN CHAPMAN, of Mystic River, Conn.—*Improvement in Cotton and Hay Presses*.—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engraving.

The inventor says: I *claim* a movable cotton press, constructed substantially as described, when operated by toggle links in combination with the pinion J and racks I I working or passing through the blocks H H, arranged to work or traverse between ways, substantially as described.

In combination with the doors T T, constructed as described, I claim the arms Z Z for closing and holding the doors closed, substantially as described.

No. 26,751.—JAMES M. CLARK, of Philadelphia, Pa.—*Improvement in Flour Mills*.—Patent dated January 10, 1860.—This invention consists in the combination of a main grinding and a regrinding mill, with two or more bolts, and a series of valves and apertures.

The inventor says: I *claim*, first, the arrangement of the centre elevator E, one trunk of which passes into the bolt chest, and when so arranged the combination of said elevator with the bolts B and C and conveyor K, as set forth.

Second. I also claim one continuous bolt chest L, containing two separate reels placed in a line, or end to end, in combination with the centre elevator E, as set forth.

No. 26,752.—R. M. CURTICE, of North Adams, Mich.—*Improvement in Cider Mills*.—Patent dated January 10, 1860.—This invention consists in combining with the ordinary

fluted cylinders previously used for crushing apples, a spheroidal toothed cutter or grater placed within a suitable hopper. It also consists in using, in connection with the fluted cylinders, the clearers G so arranged as to free the interstices of the cylinders from the crushed apples.

Claim.—The combination of the spheroidal cutter C and fluted cylinders E E arranged to operate substantially as and for the purpose set forth.

No. 26,753.—D. DE FORREST DOUGLASS, of Springfield, Mass.—*Improvement in Artificial Legs.*—Patent dated January 10, 1860.—The claim and engraving will explain the nature of this invention.

The inventor says: I *claim*, first, the piece *e* applied in combination with the stop *c* to pass between the said stop and the front part of the thigh piece, substantially as and for the purpose set forth.

Second. The employment of a mortise and tenon ankle joint *g h h* constructed as described, in combination with a spring applied substantially as described, for controlling the action of the foot and toe.

No. 26,754.—AUGUSTUS ECKERT, of Dayton, Ohio.—*Improvement in Pulmonometers.*—Patent dated January 10, 1860.—This invention consists in furnishing the bottom of the inner or measuring cylinders C with a close compartment, which surrounds the same, for the purpose of steadying said cylinder in its motion, and causing it to remain stationary at any point to which it has been blown up, so as to indicate with accuracy the vital capacity of the lungs.

Claim.—The application of the buoy E to the bottom of the floating chamber C for the purposes, and substantially as set forth.

No. 26,755.—HOWELL EVANS, of Philadelphia, Pa.—*Improved Inkstand.*—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engraving.

Claim.—The reservoir B with the cup-shaped mouth *a*, constructed substantially as described, and so hung to any suitable standard A, and arranged in respect to the screw or screws *h*, or their equivalents, that by operating the said screw or screws the reservoir will be so tilted on the stand as to cause the ink to flow either to or from the cup-shaped mouth, for the purpose specified.

No. 26,756.—H. B. FAY, of New York, N. Y.—*Improvement in Stoves.*—Patent dated January 10, 1860.—This invention consists in combining a wood and a coal burning stove in such a manner that either kind of fuel (wood or coal) may be used as desired.

Claim.—The arrangement of the coal fire-chamber B within the body or case A, the flue *d* and the pipes *e f*, communicating respectively with the smoke pipe F and the interior of the case A, for the purpose specified.

No. 26,757.—E. P. FURLONG, of Charlestown, and THOMAS LEAVITT, of Malden, Mass.—*Improvement in Weighing Apparatus.*—Patent dated January 10, 1860.—As the lever *a* is depressed, by placing any substance in either scale pan *b* or *c*, the index finger is raised and the shaft *i* partially rotated, thereby raising the adjustable weight *q* and bringing it nearer to the fulcrum of the lever *e*.

Claim.—The arrangement of the weight *q*, operating substantially as set forth, in combination with a weighing mechanism, for the purpose specified.

No. 26,758.—ISAIAH W. GILL, of Exeter, N. H.—*Improved Rig for Reefing Fore and Aft Sails.*—Patent dated January 10, 1860.—The claim and engraving explain the nature of this invention.

Claim.—The arrangement and application of the sail gaff and cross-trees with respect to the mast and the main boom sail and gaff, and not only providing the extra sail with furling lines or devices, but the main gaff with appliances by which it may be made to operate with respect to the mast, all substantially as specified.

No. 26,759.—SAMUEL H. GILMAN, of New Orleans, La.—*Improvement in Furnaces for Burning Bagasse.*—Patent dated January 10, 1860.—This invention consists in combining with a furnace, adapted to the burning of bagasse, an auxiliary furnace or fire chamber G adapted to the burning of wood, coal, or other suitable dense fuel, and made to communicate with the bagasse furnace A, so that the products of combustion of the wood, coal, or other dense fuel shall be made to pass through the furnace or chamber in which the bagasse is consumed.

The inventor says: I *claim* the combination of an auxiliary fire chamber for burning wood, coal, or other suitable dense fuel, with the bagasse fire chamber, substantially as and for the purpose set forth.

And I also claim so combining the auxiliary furnace and its ash pit with the bagasse

furnace that both the fire chamber and ash pit of the auxiliary furnace shall communicate freely with the bagasse fire chamber, substantially as and for the purpose specified.

No. 26,760.—GEORGE GOEWY, of Philadelphia, Pa.—*Improvement in Grain Fans*.—Patent dated January 10, 1860.—The sieve L, which may be made wholly of metal or wood, consists of a series of double inclined slats; each one of these slats presents three portions, to wit: an upper portion of about one third the width of the slats, inclining upwards in the direction of the blast; a middle portion, of about one third the width of the slat, being flat, on a line with the frame of the sieve; and a lower portion, of about one third the width of the slat, inclining downwards towards the blast, in a line parallel with the upper or first-mentioned portion.

Claim.—The employment of a sieve constructed as shown and described for the purpose of cleaning grain.

No. 26,761.—GEORGE P. GORDON, of New York, N. Y.—*Improved Printing Press*.—Patent dated January 10, 1860.—The claim and engraving explain the nature of this invention.

The inventor says: I *claim* the combination of the rotating, reciprocating, inking roller frame, moving as described upon a centre with the type or form bed, when such centre and such bed shall always retain their relative positions toward each other; also the above combination in combination with the rotating ink distributing table.

Second. I claim the combination of the rotating, reciprocating, inking roller frame, or equivalent, with the impression cylinder arms, or their equivalents.

Third. I claim the rotating, reciprocating cylinder arms, or their equivalents, for holding and carrying the impression cylinder, or its equivalent, in combination with the ways or bearers, or their equivalent, for causing the impression cylinder or scraper, or its equivalent, to move evenly over the tympan and type in giving the impression.

Fourth. I claim combining with an elastic tympan a flexible metallic back, or its equivalent, substantially as described for the purpose set forth.

Fifth. I claim the combination of a vibrating tympan with a vertical bed, or a bed placed out of a horizontal position, when the impression shall be given by a cylindrical surface.

Sixth. I claim the combination of a vibrating tympan, constructed substantially as described, with the impression cylinder, or its equivalent, for the purpose specified.

Seventh. I claim giving to a vibrating tympan its periods of motion and rest, for the purposes specified, during the continued motion of the other parts of the press, substantially as set forth.

Eighth. I claim, in combination with an impression produced by a cylindrical surface, the use of a rotating ink distributing table.

No. 26,762.—SAMUEL D. HAILEY, of Jackson, Tenn.—*Improved Surveyor's Level*.—Patent dated January 10, 1860.—A is the horizontal tube; b is the socket that receives the staff holding the level; ee are the perpendicular tubes; dd are the floats which are moved freely in the tubes by the fluid; rr are the rods projecting from the floats; ff are the sights; g is the movable sight to get the required grade.

The inventor says: I *claim*, first, connecting the vertical tubes to the horizontal tube by means of a yielding joint, in any manner, substantially as described.

Second. Combining a plumb and sights with the jointed tubes to keep them vertical, for the purposes set forth.

No. 26,763.—HALVOR HALVORSON, of Cambridge, Mass.—*Improvement in the Manufacture of Candles*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with the tubular wicks of the inner lining b of sized, starched, or glazed paper, or other sufficiently impervious material, substantially as and for the purpose described.

No. 26,764.—JAMES T. HAM, of Sinatobia, Miss.—*Improvement in Cotton Presses*.—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Inclining the press, as shown, for the triple purpose of allowing the sweep that turns the windlass under the end of the press to cause the ropes or chains to wind uniformly on the windlass without overriding or chafing, and to allow the former to run back by its own gravity and spread out the levers for the next operation, as set forth.

No. 26,765.—HATSEL HIGGINS, of Orleans, Mass.—*Improved Anchor Tripper*.—Patent dated January 10, 1860.—Within a port or recess c, formed in the bulwark rail d, is applied a rotary block or tripper D, of a prismoidal or other form, such block having a journal e extending from each of its ends and into a suitable bearing form d in or applied to the rail.

In connection with such block is used a holder for preventing it from revolving, except when desired.

Claim.—The rotary anchor fluke tripper and its holder applied and used substantially as and for the purpose set forth.

No. 26,766.—EDWARD HOLMES and BRITAIN HOLMES, of Buffalo, N. Y.—*Improved Machine for Dressing Staves.*—Patent dated January 10, 1860.—The object of this invention is to plane split staves in such a manner that the grain of wood may not be cut crosswise of the stave, or that the stave may be dressed to its desired thickness and form, and at the same time retain the natural crooks and windings of the timber.

The inventors say: We *claim* the combination of the straight roller I, with the convex roller J, so as to allow the edge of the stave, as it passes into the cutters, to drop below the centre or highest part of the convex roller, or bed over which the stave moves, substantially as set forth.

Second. We claim the combination and arrangement of the straight roller I, and convex roller J, with the tilting frame C, (including the cutter,) for the purposes, and substantially as described.

No. 26,767.—THOMAS HOUGHTON, of Philadelphia, Pa.—*Improvement in Lamps.*—Patent dated January 10, 1860.—This invention consists in forming on the under side of the cap or cover of a lamp an oval or elliptical inclined flange *a*, arranged in respect to and adapted to an oval and inclined opening in the top or ferrule of said vessel, so that on inserting the oval projection into the oval opening, and turning the cap, the latter may be securely fastened to the ferrule and brought to bear on the same with a perfectly tight joint.

Claim.—The top of the ferrule A, with its oval and inclined opening, in combination with the oval and inclined flange or projection of the cap B, the said flange and opening being formed and adapted to each other substantially as and for the purposes set forth.

No. 26,768.—JOHN A. HOWLAND, of Providence, R. I.—*Improvement in Coal Sifters.*—Patent dated January 10, 1860.—This invention consists in arranging in the interior of a barrel a centre, supported by two or more arms that are attached to the inside of the barrel, which centre serves to support the sieve in such a manner that the latter can be rotated, and guided by the centre below and by the shank passing through a hole in the corner above.

Claim.—The combination, with the sieve D, of the centre plate *f*, centre *g*, boss C, and shank E, as and for the purpose shown and described.

No. 26,769.—GEORGE W. HUBBARD, of Meriden, Conn.—*Improved Molasses Gate.*—Patent dated January 10, 1860.—This improvement consists in so constructing and affixing the two parts together that the covering part will be always parallel to the face of the tube or stem when closed, whereby all leaking is prevented.

Claim.—Making the covering part adjustable, by means of the spring at each end, in the manner and for the purpose described.

No. 26,770.—JOHN W. HUDSON, of Lafayette, Ind.—*Improvement in Seeding Machines.*—Patent dated January 10, 1860.—The object of this invention is to obtain a machine that may be used both as a roller and seeding machine, both functions being performed at the same time, or, by a simple adjustment, either performed separately.

Claim.—The teeth or share D, provided with seed receptacles *h*, fitted on the rods *a*, as shown, provided with seed slides *o*, and arranged to operate substantially as and for the purpose set forth.

No. 26,771.—JOHN LANE, of Lockport, Ill.—*Improvement in the Mole of Drain Ploughs.*—Patent dated January 10, 1860.—This invention consists in constructing the mole which forms the drain, so that the front half of its length first forms what may be termed a minor arch-shaped drain, with compacted side walls; and the rear half of its length following after abruptly, instead of gradually, converts the minor drain into a major drain, or a drain of the proposed size.

Claim.—The combination, with the peculiarly constructed mole A A¹, of the shoulders *c c*, which extend from the base of the mole slope backward as they rise, and terminate at a point about midway between the back of the stem or coulter and the rear end of the mole, substantially in the manner and for the purpose set forth.

No. 26,772.—ROBERT LARTER, JR., of Newark, N. J.—*Improvement in Apparatus to Feed Paper to Printing Presses.*—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, simultaneously moving inward a series of friction pieces from near the edge of the pile of paper, while a corresponding series of legs are pressed upon the pile at points nearer the centre thereof, so as to cause the surface of one or more of the sheets at or near the top of the pile to rise in the space between the rubber and the legs, the upper one being raised more than the rest, and being thereby separated therefrom by a considerable stratum of air.

Second. I claim, in connection with hollow and vacuous legs G^1 , used in the manner substantially as shown, bevelling the basis of the legs to correspond with the inclined position assumed by the upper sheet C, under the action of the friction pieces M.

Third. I claim controlling the apertures between the hollow legs G^1 , or their equivalents, and a vacuous space; and also operating all the friction pieces M, or their equivalents, by a partial rotation of a trunk H, arranged substantially as and so as to produce the effects set forth.

Fourth. I claim allowing for variation in the height of the pile of the paper by providing slots, or equivalent "lost motion," in the connections F F^1 , or their equivalents, and determining the time of the rubbing action; and also the time of producing the vacuum in the legs G^1 , or their equivalents, by the contact of L, or an equivalent portion of the separating apparatus with the pile of paper.

Fifth. I claim elevating the front edge of the sheet, after its separation from the pile, and pressing the same against a series of tapes V, by a blast of air, arranged substantially in the manner shown, for the purpose of ensuring the forward motion of the sheet so soon as the vacuum in the legs G^1 is destroyed. I also claim, in combination therewith, effecting the complete separation of the upper sheet from the remainder of the pile by the deflection backward of a portion of the same air after its action on the front edge of the sheet, substantially as and for the purposes set forth.

Sixth. I claim securing a correct position of the front edge of the sheet by carrying it forward in advance of the time it is required to be delivered to the press, and by sliding forward the tapes or equivalent supports beneath it, while stops Q Q, or their equivalents, are presented to its front edge for the purpose of turning it into a correct position, if askew.

Seventh. I claim giving a side motion to the sheet to secure a correct position of one of its edges by a continuous movement of the rollers X, or their equivalents, as set forth.

Eighth. I claim reversing the side movement of the sheet so as to register, by either edge, at pleasure, substantially in the manner shown.

No. 26,773.—WALTER G. MACKAY, of New York, N. Y.—*Improvement in Ventilating Sinks, Water Closets, &c.*—Patent dated January 10, 1860.—The perpendicular soil pipe B is continued up into the pipe A, above the trap, which is beneath the basin. The ventilating pipe A may be extended out at the top of the house, or reach into a flue built in the wall.

Claim.—The application of the ventilating pipe A, at the upper bend of a bent pipe trap, and at its junction with the soil pipe B, in combination with said trap and soil pipe, in the manner and for the purposes specified.

No. 26,774.—ELI MANROSS, of Bristol, Conn.—*Improved Latch for Gates.*—Patent dated January 10, 1860.—A is a plate of metal firmly secured to the post and having on its surface a trough-like projection in which is imbedded a straight metallic spring B, resting upon its ends near the bottom of the trough; C is a movable catch or button turning upon the pivot D and pressing upon the middle of the spring B, within the trough.

Claim.—The latch for doors and gates, consisting of a movable catch retained in place by a spring, and acted upon by a slotted plate and projection, substantially in the manner and for the purpose described.

No. 26,775.—E. J. MCCARTHY, of New York, N. Y.—*Improvement in Machinery for Burring Wool.*—Patent dated January 10, 1860.—This invention consists in combining with the draw roller, the breast plate, and the stripper, a pair of feed rollers, the upper one of which is serrated for the purpose of holding one end of the fibre while the opposite end is held by the breast plate and feed roller, in order to produce a tension on the fibre so as to cause it to be drawn out by the stripping plate, and also bent downward over the edge of the stripping plate, at the end of its upward motion, and thus present it to the stripping plate in a thinner sheet and in such position that the burr is more easily removed.

Claim.—The combination of the feed rollers with the stripping plate and the draw roller, arranged substantially as described for the purpose set forth.

No. 26,776.—GEORGE A. MEACHAM, of New York, N. Y.—*Improvement in Buttons.*—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a button composed of the swelled or headed shank A A^1 , and outer rim B, so combined and arranged as to allow the rim to rotate and assume

various angular positions, without twisting or straining the cloth, or fastening around the shank while being buttoned or unbuttoned, substantially as set forth and described.

Second. The teeth *a*, arranged at the base of the shank *A*, substantially as and for the purpose set forth.

No. 26,777.—JOHN MINER and SILAS MERRICK, of New Brighton, Pa.—*Improvement in Iron Railroad Cars*.—Patent dated January 10, 1860.—This invention consists in constructing the panels which fill the spaces between the framework of the car, of a single piece of sheet metal of suitable thickness raised by the hammer or by dies, so that they are struck up in the centre, with an ornamented or plain raised concave from the interior of the car.

Claim.—The employment of panel plates composed of a single piece of sheet metal struck up (whether such raised parts be ornamented or plain) and secured to the framework, substantially in the manner and for the purposes described.

No. 26,778.—THOMAS MITCHELL, of Lansingburgh, N. Y.—*Improved Machine for Boring Brush Hooks*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, attaching brush blocks *r* to the faces of a polygonal drum *E*, having an intermittingly rotating movement, an intermittingly longitudinal sliding movement, and a reciprocating feed movement, in connection with rotary drills *p p*, (one or more,) for the purpose of boring the blocks to receive the bristles.

Second. The arrangement of the racks *f g* on the cylinder *F*, plate *H*, bar *G*, connected with the grooved bar *h*, the stop bar *I*, and slide *C C*¹, operated as shown, and having the shaft *D* of the drum and cylinder fitted in them, with the weight *M* attached, for giving the necessary movements to the polygonal drum *E*, for the purpose set forth.

No. 26,779.—JAMES MONTGOMERY, of Baltimore, Md.—*Improvement in the Construction of Steam Boilers*.—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Making vertical, or nearly vertical, water tubes for steam boilers or other purposes with their lower ends, to which the heat from the furnace is applied at its lowest temperature, thicker for any desired portion of their length than their upper ends to which the heat is applied at its greatest intensity, in the manner and for the purposes substantially as set forth.

No. 26,780.—CAMPBELL MORFIT, of New York, N. Y.—*Improvement in Compositions for Coating Candles*.—Patent dated January 10, 1860.—The claim explains the nature of this invention.

Claim.—The covering of tallow, stearine, or other candles with paraffine or paraffine mixtures, substantially as set forth, for the purpose of hardening their surface and improving their appearance and burning qualities.

No. 26,781.—JOSEPH R. PALMENBERG, of New York, N. Y.—*Improved Frame for Ladies' Dresses*.—Patent dated January 10, 1860.—This invention consists in constructing ladies' figures in such a manner that the same may be readily taken apart when required to be packed in a box, so that they may occupy less room in transportation.

Claim.—The arrangement and construction of ladies' figures in parts, and the manner of fastening the separate parts together, substantially as described and for the purpose specified.

No. 26,782.—WASHBURN RACE, of Seneca Falls, N. Y.—*Improvement in Stove Registers*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application of the two damper plates *F F*¹ to the register plate *A*, when geared together, so as to open upward simultaneously from the apertures *E E*, situated at the bottom of the said register plate through the connection of the single clutch lever *G*, with the expansive rod *C*, in combination with said clutch lever and expansion rod, substantially in the manner and for the special purposes specified.

No. 26,783.—HENRY RASQUIN, of New York, N. Y.—*Improvement in Skate Fastenings*.—Patent dated January 10, 1860.—This invention consists in so constructing the lower part of the boot and the skating iron that they may be attached to each other without tying, buckling, or strapping.

The inventor says: I *claim*, first, providing the skating iron with two pins or wedges, substantially as described.

Second. Providing the boot or shoe with a groove *F* and with spring boxes *H* and *K*, substantially as described and for the purpose set forth.

No. 26,784.—ROBERT L. REANEY, of Philadelphia, Pa.—*Improvement in Gold Separators*.—Patent dated January 10, 1860.—This invention combines in one machine the following operations: grinding the gold quartz, or other mineral with which gold is found associated, and reducing the same to a pulverulent state, and washing and carrying off the light particles, which are mechanically held in suspension by a stream of water acting upon them in a peculiar manner.

Claim.—The arrangement of the case J, weight pan K, shaft I, rollers H H¹, central overflow tube B, and exit pipe L, as and for the purpose shown and described.

No. 26,785.—GEORGE W. ROBERTSON, of Philadelphia, Pa.—*Improvement in the Waste Cocks of Hydrants*.—Patent dated January 10, 1860.—This invention consists in so constructing the cock that the waste water, as it is discharged, shall be caused to wash the joint which is formed at the place of junction of the plug with the upper end of the barrel of the same.

Claim.—Causing the "waste water" of a hydrant, pave-washer, or other similar hydraulic apparatus, to wash the joint produced at the junction of the plug with the upper part of the barrel of the waste-cock thereof, substantially in the manner and for the purpose set forth and described.

No. 26,786.—F. W. ROBINSON, of Richmond, Ind.—*Improvement in Horse Powers*.—Patent dated January 10, 1860.—This invention consists in balancing the wheels F F¹ upon the pinion G, whereby much friction and consequent wear and tear are obviated.

Claim.—The peculiar arrangement of the pinions c, bevel gears C C, shafts D D¹, master wheel B, pinions E E¹, shafts e e¹, gears F F¹, pinion G, shaft H, cross bars J J¹ K L, as and for the purpose shown and described.

No. 26,787.—C. B. ROGERS, of Norwich, Conn.—*Improved Machine for Cutting Mouldings*.—Patent dated January 10, 1860.—This invention consists in the use of feed rollers and cutter heads arranged obliquely with the stick, in such a manner that the feed rollers will impart both a rotary and a longitudinal rectilinear movement to the stick, while the cutters will act on the stick in a plane obliquely with it, and cut the spiral bead or beads thereon.

The inventor says: I *claim*, first, the use of rotary cutter heads K K, provided with necessary cutters, and placed obliquely with the stick E, to be operated upon when said stick is fed between or underneath the cutters K K, with a combined rotary and rectilinear movement, for the purpose set forth.

Second. The combination of the feed rollers and cutter heads, arranged for joint operation as described.

No. 26,788.—WILLIAM SCHAUBEL, of Philadelphia, Pa.—*Improvement in Steam Boilers*.—Patent dated January 10, 1860.—This invention consists of a coiled flue G, and a chimney H, arranged within another casing A, in respect to the inner and outer casing C B of a fire chamber, and tubes I I, connected with the latter so as to form a steam boiler which presents an extensive heating surface in a small compass.

Claim.—The arrangement of the casing A, with its coiled flue G, chimney H, and the outer casing B, and inner casing C, and tubes I I, of the fire box.

No. 26,789.—J. A. SHEFFER, of Rochester, N. Y.—*Improvement in Coal Sifters*.—Patent dated January 10, 1860.—This invention consists in an arrangement of parts whereby the cinders are easily separated from the ashes without any danger of the dust being diffused in the apartment.

Claim.—The combination and arrangement of the rockshaft H R a a, and ways W W, with the riddle B, and containing box A, in the manner and for the purpose substantially as set forth.

No. 26,790.—ABRAHAM SCHULTZ and DAVID SCHULTZ, of Reading, Pa.—*Improved Washing Machine*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hexagonal rubber E, with the spiral cleats O O¹, on the periphery, as set forth, in combination with the cross brace B, and connecting rods M M¹, attached to one crank or eccentric for imparting a double concentric oscillating motion to the tub A, and the hexagonal rubber E, when constructed, arranged, and combined as and for the purpose described and set forth.

No. 26,791.—FRANKLIN SKINNER, of New Haven, Conn.—*Improved Machine for Cutting Shavings for Mattresses*.—Patent dated January 10, 1860.—This invention consists in the use of two face wheels, one to carry the block to be cut into shavings, and the other to carry the cutters, and in setting the faces of these in such relation to each other that the outer edge of

the cutters when the wheels are revolving will pass across the disk of the other wheel in the direction of its diameters, or through the longitudinal centre of the block, so as to cut a shaving from one half the width of the block at each revolution of the wheel.

Claim.—The combination of the two wheels B and D, or their equivalents, with their appendages, when the whole is constructed and made to produce the result substantially as described.

No. 26,792.—R. L. SMITH and C. SMITH, of Stockport, N. Y.—*Improvement in Machines for Finishing Leather.*—Patent dated January 10, 1860.—The object of this invention is to obtain a machine whereby the length of the stroke or vibration of the tool, as well as the pressure of the same on the leather may be regulated with the greatest facility. The face of the tool is also kept parallel with the face of the bed over which the leather passes, and the latter fed to the tool by an automatic mechanism evenly and with a regular movement.

The inventors say: We *claim*, first, the combination of the polishing tool L, with a horizontally moving stock I, and bar K, arranged and operating substantially as shown and described.

Second. The arrangement and combination of the vertical feed-regulating screw G, lever H, and bar E, as and for the purpose set forth.

Third. The arrangement of the horizontal feeding nut M, screw N, and shaft r, as and for the purpose shown and described.

Fourth. The combination, with the crank A and rod O, of the movable rack P, pinion and shaft p q, whereby the length of stroke of the polishing tool may be changed at pleasure.

No. 26,793.—SAMUEL M. SMITH and CALEB WINEGAR, of Union Springs, N. Y.—*Improvement in Drain Tile Machines.*—Patent dated January 10, 1860.—The pulverized clay empties into the screening box; from thence it is forced through the screens into the moulding box, and from thence through the tile moulds; the arrangement being such that while the clay is being screened at one end of the machine, pulverized clay is coming into the screening box at the other end, and screened clay is forced out through the tile moulds.

Claim.—The relative arrangement for united operation of the screening box B, tile making box C, screening plunger F, tile plunger G, eccentrics d e, for operating said plungers F G, pulverizing chamber A, and feeding shaft D, substantially as and for the purposes set forth.

No. 26,794.—JOHN SOUTHER, of Boston, Mass.—*Improvement in Apparatus for Evaporating Saccharine Juices.*—Patent dated January 10, 1860.—This invention consists in attaching a steam cylinder F to a car C, which is mounted on a track B B, raised above a train of sugar kettles A A, with a ladle J, suspended to the lower end of the piston rod I.

The inventor says: I *claim*, first, a portable steam ladle for bailing hot sugar cane juice from one kettle to another, or the finished sugar to the coolers, as described.

Second. I claim the ladle constructed with a valve in the bottom, to receive the cane juice or sugar, and a hollow handle or spout, through which the contents of the ladle are discharged, the outer end of said spout being suspended at a fixed height, substantially in the manner and for the purpose described.

Third. I claim the combination of mechanism described, substantially in the manner and for the purpose set forth.

No. 26,795.—SAMUEL SQUIRE, of Brooklyn, N. Y.—*Improvement in Hydrostatic Balances.* Patent dated January 10, 1860.—Any ponderable substance placed on the platform A communicates a force or pressure through the diaphragm B to the surface of the liquid, which liquid is thereby forced through the channel D up the column C until it has attained an altitude which exactly balances the weight of the substance placed upon the platform A.

Claim.—The diaphragm B, adjustable index scale E, fluid column C, and levers shown in figures 4 and 5, the whole constructed and arranged substantially as described.

No. 26,796.—J. K. STAMAN, of Mifflin, Ohio.—*Improvement in Cultivators.*—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the bows A and D, arranged relatively as specified, and having their lower ends chamfered as described, the cultivating teeth or shares P, and the connecting brace strap Q, when the whole is constructed and arranged as before set forth, for the purposes specified.

No. 26,797.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Machinery for Moulding Candles.*—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the mould box or sliding frame E E in a stationary frame A B, in combination with the tip stands H at the base of the stationary frame, by means of which, in the descent of the moulds, the candles are discharged therefrom, as specified.

Second. I claim drawing the wick into the mould by means of the jaws O P, and retaining the wick in its proper position in the mould, as described.

Third. I claim the blades X in combination with the plates upon the jaws P, for the purpose of severing the wick after it has been secured between the jaws O P.

Fourth. I claim the blade attached to the rack M, for the purpose of cutting off the butt end of the candles, and separating the sprue tallow from the bottom of the sprue box.

Fifth. I claim the candle rack Q Q¹ and R R¹, arranged and operating substantially as described, for the purpose of removing the candles after they are discharged from the moulds.

Sixth. I claim the described sprue box of adjustable parts—1st, to retain the tallow; 2d, to effect the removal of the sprue tallow, as set forth.

No. 26,798.—GEORGE A. STANLEY, of Cleveland, Ohio.—*Improvement in Machinery for Moulding Candles*.—Patent dated January 10, 1860.—This invention consists in the construction of devices by means of which the butt or large end of the candles are cut from the sprue and the sprue removed, and the candles discharged from the machine by means of the discharging rack, after the candles are out of the moulds.

The inventor says: I claim the arrangement of the blades E upon the bar D, for the purpose of cutting off the butts of the candles and scraping the bottom of the sprue box.

Second. I claim forming the ends and sides of the sprue box of the rectangular frame H F¹ G G¹, and removing the sprue tallow by means of the movement of this frame, as specified.

No. 26,799.—DAVID THAIN and WILLIAM JACKSON, of Philadelphia, Pa.—*Improvement in obtaining Fatty Matters from Residuum*s.—Patent dated January 10, 1860.—The steam and fatty vapor are eliminated from the acid bottoms by the heat of the still, and both pass together to the condenser, where they are condensed and caused to separate by the difference of their specific gravities.

Claim.—Obtaining the fatty acid and other fatty matter remaining in the acid bottoms by distillation, in contact with superheated steam, substantially as described.

No. 26,800.—R. B. THOMPSON, of Galesburg, Ill.—*Improvement in Tanning Compound*.—Patent dated January 10, 1860.—The composition is as follows: ten pounds root of the polygonum bistorta, two pounds root of the geranium maculatum, one quarter pound sulphate copper, one barrel weak solution catechu, tan bark, or hot water.

Claim.—The combination and use of the several ingredients, compounded in proportion as described, for the purpose of tanning leather from hides, as set forth.

No. 26,801.—LAURISTON TOWNE, of Providence, R. I.—*Improvement in Making Chains from Sheet Metal*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, forming that portion of the carrier in which the blank link is transported in such a manner that it can be made to turn on an axis which shall be coincident with the axis of the blank link upon it, substantially as described.

Second. The combination of the supplemental plate, or its equivalent, with a stop H or its equivalent, for the purpose of determining the extent of rotation which shall be given to the plate E, and thus insure the proper presentation of the blank to the chain, substantially as described for the purpose specified.

Third. I claim the mode of operation, substantially as specified, by means of which the punch N, stop E, and bending picks d d d, or their equivalents, are made to coöperate in alternate positions in relation to the forming tube, for the purposes set forth.

No. 26,802.—GEORGE J. WARDWELL, of Barnston, Canada.—*Improvement in Stone Dressing Machines*.—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I claim the combination of a "stunner" and cutter together, or in the same instrument, the stunner preceding the cutter in its action both to "stun" the material for the cutter and to gauge the depth of its cut, substantially as described.

I also claim the arrangement of the shafts i and j of the band pulleys u s upon frames v p, distinct from and pivoted to the bed frames x r, so that said shafts may be brought to a horizontal position (nearly or exactly) when the machine is working in an inclined position, in the manner and for the purposes specified.

I also claim the arrangement and combination of the lever L, shipping frame M, pulleys G and p, shaft E, pinion I, feed finger k, stay finger b, and sword h², whereby the shipping frame and feed and stay fingers are operated by one and the same movement of the shipping lever, substantially in the manner and for the purpose specified.

No. 26,803.—**ARETUS A. WILDER**, of Detroit, Mich.—*Improved Clapboard*.—The object of this invention is to facilitate the painting, and to make a surface by so rounding or bevelling the edges that the building covered by this siding, clapboards, or ceiling, shall be completely washed by the rain, as will not be done by square edged siding.

Claim.—Rounding or bevelling the lower edge of clapboards, siding, or ceiling, for the purposes set forth.

No. 26,804.—**W. F. M. WILLIAMS**, of Augusta, Ga.—*Improvement in Bridle Bits*.—Patent dated January 10, 1860.—This invention consists in a combination of lever powers, so arranged as to operate on one or both jaws, (upper and lower,) at the discretion of the reins man.

The inventor says: I *claim* a bridle bit constructed in any manner substantially as set forth and shown.

Second. I claim combining sliding levers with two bars E F in the mouth, and adapting this construction to any bit now known, substantially as and for the purposes set forth.

Third. I claim the combination of an elastic I and leather strap J, connected as shown, with the circular sliding lever, and the bar in the mouth, in the manner set forth and shown.

No. 26,805.—**M. P. WILMARTH**, of Pawtucket, R. I.—*Improvement in Ring Spinning Frames*.—Patent dated January 10, 1860.—This invention consists in constructing the ring employed in the ring spinning frame with a narrow upwardly projecting rim *a*, arranged between the inner and outer margins of the face of the ring.

Claim.—The construction of the ring with the upwardly projecting rim *a*, substantially as described, for the purpose set forth.

No. 26,806.—**OLIVER D. WOODRUFF**, of Southington, Conn.—*Improved Meat Cutter*.—Patent dated January 10, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The employment and arrangement of the revolving plate K within the case A A¹, with reference to the fingers *c* and cutters *a*, operating substantially in the manner and for the purpose described.

No. 26,807.—**EDWARD BAGOT**, of New York, N. Y., assignor to G. B. GORDON, of said New York.—*Improved Beer Measure*.—Patent dated January 10, 1860.—This invention consists in admitting the beer into the lower part of the measure and also pouring the beer from the lower part, by which arrangement the froth is prevented from forming in large quantities, and the froth that does form allowed to rise above the inner end of the discharge spout, so that it may subside without being discharged from the measure.

Claim.—The combination of the two pipes B C applied to the beer measure, as and for the purposes set forth.

No. 26,808.—**FRANCIS D. BALLOU**, of Abington, Mass., assignor to himself and J. L. NASH, of said Abington.—*Improvement in the Manufacture of Boots and Shoes*.—Patent dated January 10, 1860.—The upper, with the welt, is lasted by tacking, pegging, or nailing the edges of both welt and upper to the inner sole. The outer sole is then attached by sewing through the edge of the welt and edge of the outer sole, and the shoe is ready for trimming and finishing in the usual manner.

Claim.—Attaching, by sewing, the welt or strip of leather to the uppers of boots and shoes preparatory to lasting the same, thus enabling the work to be performed by sewing mechanism, substantially in the manner and for the purposes set forth.

No. 26,809.—**HENRY BELFIELD**, of Philadelphia, Pa., assignor to himself and JUSTICE COX, of said Philadelphia.—*Improved Latch for Sliding Doors*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The handles D D jointed to the plates C C, with the spring latch G, or its equivalent, and the whole applied to a sliding door, substantially as set forth, so that the force applied to either of the handles for sliding the door open may be the means of detaching the latch from the jamb, as specified.

No. 26,810.—**THEODOR BLUME**, of Cincinnati, Ohio, assignor to himself and W. W. HAMER & Co., of said Cincinnati.—*Improved Machine for Facing Pulleys*.—Patent dated January 10, 1860.—The relative greater speed of the stone causes it to act very expeditiously and effectively, and to wear equally around its periphery, although of uneven grit or density. The weight of the hinged and gravitating frame F and of its contents, holds it firmly down to whatever height it may be adjusted by the nut G.

Claim.—The described arrangement of the grindstone A, hinged frame F, nut G, post H

spindles K K¹, and adjustable bearing L, the whole being constructed and combined in manner substantially as and for the purpose set forth.

No. 26,811.—SETH BOYDEN, of Newark, N. J., assignor to himself and H. H. JAKES, of said Newark.—*Improvement in Machinery for Forming Hat Bodies*.—Patent dated January 10, 1860.—This invention consists in placing directly in front of the picker a plate so bent or curved that its surface will have a certain relative position to the axis of the picker and the surface of the cone, and give such a direction to the fur, as the latter is thrown on it by the rapid motion of the picker, that the fur will be drawn properly on the cone by the exhaust or suction within it.

Claim.—The fur director or plate E, curved or bent, substantially as shown and arranged in relation with the cone B and picker D, to operate substantially as and for the purpose set forth.

No. 26,812.—GEORGE BRADLEY, of Paterson, N. J., assignor to JACOB ROGERS, of said Paterson.—*Improvement in the Cap Spinning Frames*.—Patent dated January 10, 1860.—This invention consists in the employment of a tube with a groove extending longitudinally along its exterior, in combination with a collar of corresponding form, and with a dead spindle and cap so arranged and operating, that while the combination is adapted to work as rapidly as the ordinary dead cap spindle, the bobbin is traversed without changing the position of the cap or tube.

Claim.—The combination of the grooved tube C c, and collar E E¹, with the dead spindle and cap A B, when the whole is operated substantially in the manner and for the purpose set forth.

No. 26,813.—WILLIAM B. CARD, of Sag Harbor, N. Y., assignor to himself and JOHN SHERRY, of said Sag Harbor.—*Improved Alarm for Drawers*.—Patent dated January 10, 1860.—This invention consists in a novel arrangement of levers and stops with a knob-arbor, and an alarm placed within a suitable case, and applied to a drawer or till, whereby the drawer or till cannot be illegitimately opened, or an effort made to thus open it, without an alarm being sounded.

The inventor says: I claim the slide I, arranged with the bar H, and knob-arbor or spindle J, levers F F G, and stop bar D, and used in connection with the alarm C, substantially as and for the purpose set forth.

I further claim the slide bar L, when arranged with the bar H of the slide I, in connection with the projection s on the underside of the counter or table M, as and for the purpose set forth.

No. 26,814.—ORRIL R. CHAPLIN, of St. Johnsbury, Vt., assignor to himself and O. G. HALE, of Waterford, Vt.—*Improvement in Mowing Machines*.—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim making the cutter bar or holder E in sections hinged together, in manner and for the purpose substantially as specified.

And in combination with so making the cutter bar, I claim making the connection F of the tails of the cutters, in sections hinged together and to a connecting rod, essentially as described.

I also claim making each tooth l situated at the junction or joint of each two sections of the cutter bar in two parts hinged together, constructed and applied respectively to the two sections, as and for the purpose specified.

I also claim combining with the cutter bar made in sections, connected as described, a stiffener L constructed and made to operate, substantially as described.

I also claim combining the lever N and the shaft M together, and to the frames A and D, substantially as specified, in order that, by means of simultaneous movements of the lever in backward and lateral direction, the cutter bar frame may be elevated and the stiffener impelled forward at one and the same time.

No. 26,815.—LEWIS L. CHICHESTER, of New York, N. Y., assignor to HENRY G. EVANS, of said New York.—*Improvement in Cotton Gins*.—Patent dated January 10, 1860.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I claim, first, the employment or use of the flanged shaft P, arranged relatively with the roller E, guard plate G, screen H, and feed board I, to operate substantially as and for the purpose set forth.

Second. The combining in one piece of the guard plate G, screen H, and feed board I, substantially as shown for the purpose specified.

Third. The corrugated roller E in combination with the auxiliary smooth roller F and roller C, with or without the elastic surface D, arranged or disposed so that the roller F may

serve in the capacity of a stripper to the roller E, or both as a stripper and draw roller, as described.

Fourth. The employment or use of the discharging roller Q R, applied to the roller cotton gin, and arranged to operate substantially as and for the purpose set forth.

Fifth. The employment or use of the guard plate G, either vibratory or stationary, in combination with the rollers E F and B, substantially as set forth.

No. 26,816.—JOHN DICK, of New York, N. Y., assignor to himself and S. C. HILLS, of said New York.—*Improvement in Sewing Machines*.—Patent dated January 10, 1860.—This invention consists in the manner of applying two dogs, the one to move, and the other to prevent the backward movement of, the feed wheel, whereby the necessity of the application of a friction brake to the said wheel is dispensed with, and the said wheel, though secured against any tendency to turn the wrong way, is permitted to turn in the right direction with very little friction.

The inventor says: I claim, first, the combination of a feeding dog attached to a lever working on a fixed axle, on which the feed wheel rotates, and a retaining dog carried by an arm rigidly secured to the said axle, substantially as described.

Second. The combination with the lever which carries the feeding dog of a crank H, applied to slide across the end of a hollow shaft G, a lever I, applied within the said shaft, and connecting the said crank with a screw arranged transversely to the said shaft, and an index attached to the said screw outside of a dial attached to the exterior of the said shaft; the whole applied and operating substantially as described for the purpose set forth.

No. 26,817.—HENRY C. FOOTE, of Fredericktown, Ohio, assignor to himself and C. KILGORE, of Chattanooga, Tenn.—*Improved Combined Watch Key and Calendar*.—Patent dated January 10, 1860.—This invention consists in combining with a shield A an adjustable circular plate B; on the latter is inscribed the days of the months and days of the week, and on the former the days of the month, the whole forming an almanac which may be adjusted so as to readily indicate the day of the week or month.

Claim.—The combined calendar and shield as a new article of manufacture, the same consisting of a shield, circular plates, and split ring, as described.

No. 26,818.—FRANKLIN B. HUNT, of Cincinnati, Ohio, assignor to R. D. VAN DUERSON and IRA B. GIBBS, of said Cincinnati.—*Improvement in Mills*.—Patent dated January 10, 1860.—This invention consists in the employment of a reversible block Q, arranged in combination with a grinding cylinder J, and a shelling cylinder K, so that the mill can be arranged for shelling corn or grinding apples.

The inventor says: I claim, first, the reversible block Q, secondary frame M, and cylinder carrier F G H, constructed and arranged for the use of different cylinders, substantially as described.

Second. In combination with the above arrangement of parts, I claim the feed plates U, constructed and arranged to operate substantially as described.

No. 26,819.—JOSEPH I. KNIGHT, of Philadelphia, Pa., assignor to himself, THOMAS PATTERSON, and JAMES LYNDELL, of Bristol, Pa.—*Improvement in Corn Planters*.—Patent dated January 10, 1860.—This invention consists of an axle with a sleeve provided with ratchet wheels for operating the planting levers, and having a clutch box *d e*, operated by a lever F, connected to a catch *y* for operating a third ratchet wheel *q* on the sleeve, and also connected to a lever W on a shaft *x*, to which the plough teeth H for opening the furrows are hung, so arranged for joint action that the sleeve may be partially turned to its proper position on the axle, the plough teeth depressed or raised, and the clutch thrown in or out of gear by the operation of one lever.

Claim.—The axle C with the sleeve E, its ratchet wheels *ff*, operating the levers *h*, the clutch box *d e*, operated by the lever F, the latter being connected to a catch *y* for operating the ratchet wheel *p*, and also connected to the lever W on the shaft *x*, for operating the plough teeth H, when the whole of the parts are combined for joint action, as and for the purpose set forth.

No. 26,820.—WILLIAM P. PATTON, of Harrisburg, Pa., assignor to himself and WILLIAM MOYER, of said Harrisburg.—Patent dated January 10, 1860.—*Improved Stopper for Preserve Cans*.—This invention consists in the arrangement of a circular base or bottom piece, having its outer edge or circumference levelled, and a screw stem rising perpendicular in its centre, an annular India rubber cushion or gasket or cylindrical section, which passes over and encircles the upper part of the bevelled edge of the said base, and an annular wedge, which is adapted to bear by its outer inclined plane upon the inner side of the gasket, and cause the latter to expand as the said annular wedge is held concentric therewith, and forced towards the said base by means of a circular cap plate, which is adapted to traverse the screw stem of the base when rotated thereon.

Claim.—The peculiar combination and arrangement of the several parts A B C D, or their equivalents, substantially in the manner and for the purpose set forth and described.

No. 26,821.—WILLIAM SMITH, of Pittsburg, Pa., assignor to SMITH, PARK & Co., of said Pittsburg.—*Improvement in Railroad Car Wheels.*—Patent dated January 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making railroad car wheels, having cast iron rims and hubs with a rim plate, either sinuous or otherwise, extending around and underneath the rim, the hub and rim being connected by wrought iron spokes, placed alternately at the outer and inner face or edge of the rim and hub, in the manner described, for the purpose of distributing the bearing or pressure of the spokes, so as to make it equal on both edges of the rim and hub.

Second. Making the cast iron rim of railroad car wheels with a sinuous rim plate cast in one piece with the rim, and extending around the inner face of the rim, the rim plate being so shaped that both of its edges (following its windings) are of equal length to each other, and also to the circumference of the outer face or tread of the wheel, for the purpose of securing an equal degree of contraction of the rim and rim plate, at the same time strengthening and bracing the rim and supporting the strain of the wrought iron spokes.

Third. Also the combination in railroad car wheels of a cast iron rim, having a waving or sinuous rim plate around its under or inner circumference, with a cast iron hub connected with the rim plate and rim by means of wrought iron spokes arranged alternately near the inner and outer face of the wheel, substantially in the manner described.

No. 26,822.—L. A. DOLE, of Salem, Ohio, assignor to himself and ALBERT R. SILVER, of said Salem.—*Improved Tool for Cutting Round Tenons.*—Patent dated January 10, 1860.—The end of the piece of wood on which a round tenon is to be cut is inserted into a hollow tube which has at its front end several radial rests and a radial cutter. The tool is revolved, and the stick, being fed forward on the rests, has a perfectly round tenon formed on it by the cutter, the length of the tenon being gauged by means of an adjustable stop at the rear end of the tube.

The inventor says: I *claim*, first, the arrangement of the flanged cylinder A, face plate D, radial rests *e e e*, and cutter *f*, in the peculiarly constructed adjusting ring C *g*, substantially as and for the purpose set forth.

Second. The combination of the right hand screw thread *k*, formed on the inner circumference of the flanged cylinder A, the left hand screw thread *l*, formed on the circumference of the gauge shank and the set nut F, substantially as and for the purpose set forth.

No. 26,823.—LEONARD ANDERSON, of Painesville, Ohio.—*Improved method of Hanging Reciprocating Saws.*—Patent dated January 17, 1860.—This invention consists in pivoting the upper end of the saw to a vertical sliding block, and the lower end to the short arm of a pitman rod, which has its fulcrum in a block sliding in a circular groove, so that the saw in its movement will have an alternate reciprocating and at the same time a vibrating motion, and be thrown back during its upward stroke, in order that the kerf may clear itself of saw dust.

Claim.—The combination of the saw B with the short arm J of the pitman H, pin R and slotted arc F, when the upper end of the saw moves in a right line, substantially as described, so that the saw will be carried backward during its upward stroke, but will descend on a vertical line, all as set forth.

No. 26,824.—ALBERT C. BABCOCK, of New Haven, Conn.—*Improved Curtain Fixture*—Patent dated January 17, 1860.—This improvement consists in so connecting an India rubber spring to the curtain roller that the curtain may be drawn down when desired, and detained in any desired position by the ratchet attachment, and be rolled up by the spring when desired.

Claim.—The combination of the long India rubber spring C with the curtain roller B, and its appendages, when the whole is constructed, arranged, and made to operate substantially as described and set forth.

No. 26,825.—ALBERT BAKER, of Appleton, Wisconsin.—*Improved Life-preserving Raft.*—Patent dated January 17, 1860.—This invention is a raft made in such a way that it can be readily taken to pieces and folded up in a very compact and portable shape, or put together in a few minutes. When put together it will occupy a large superficial area, and have great floating capacity, not easily upset, and will serve a useful purpose at sea or for pleasure purposes.

Claim.—The combination of extension beams C C with central beam A, ferrules D D, racks *b b*, pinions *a*, for operating each pair simultaneously, arranged in the manner and for

the purposes set forth, the whole being buoyed up out of the water by suitable bags F, as described

No. 26,826.—VINCENT M. BAKER, of Elkland, Pa.—*Improved Water Wheel*.—Patent dated January 17, 1860.—The water, in its passage through the scroll and wheel, strikes the parts *e* of the buckets C, and then acts against the parts *f*, the water striking the part *e* of one bucket, and then passing to the part *f* of a succeeding bucket, and thence into the wheel, the water, of course, having a greater speed than the wheel.

Claim.—The combination of the two series of buckets C D and scroll E, constructed and arranged substantially as and for the purpose set forth.

No. 26,827.—JESSE BATLEY, of Honeoye Falls, New York.—*Improved Machine for Directing Newspapers, &c.*—Patent dated January 17, 1860; antedated July 17, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of type on slats connected together so that they may be moved successively through a machine, in the manner and for the purposes described and set forth, or any equivalent involving substantially the same principles.

Second. The combination and arrangement of lever X X, click *a*, and ratchet wheel *b*, with cog wheels R R, for the purpose of moving slats A A, in the manner and for the purpose specified, or any arrangement accomplishing substantially the same thing.

Third. The arrangement and combination of spring *j*, pulley *g h*, and belt *f f*, for the purpose of taking up slats A A, or drum P, as specified, or its equivalent.

Fourth. The adjusting springs *d d*, for the purpose specified.

Fifth I do not claim the pin O or lip 10, separately; but I claim their combination and arrangement in the manner and for the purpose specified.

Sixth. Moving apron Z, by means of cleat 5 and click 4, in the manner and for the purpose specified, or any arrangement substantially the same.

Seventh. Drawing or moving newspapers, or other similar documents, into a machine by finger bars I I and spurs 6, in the manner specified, or any arrangement accomplishing substantially the same thing.

Eighth. The arrangement and combination of arm J, pin 9, click K, and bars L and M, in the manner and for the purpose specified, or any arrangement substantially the same.

Ninth. The arrangement and combination of lever T, clicks *x* and *d y*, ratchet wheel U, pinions on shaft 1, cog wheels *z*, drums *p*, belts N, cleats *q*, &c., for the purpose of elevating boxes *r r*, in the manner and for the purpose described and set forth, or any arrangement accomplishing substantially the same thing.

Tenth. I claim the method described of securing type in type boxes by means of screw 12 and wedge block 13, as shown in figure 4.

No. 26,828.—SMITH BEERS, of Naugatuck, Conn.—*Improvement in Machines for Pulling and Cutting Cotton Stalks*.—Patent dated January 17, 1860.—This invention will be understood by referring to the claim and engravings.

The inventor says: I *claim* the construction, arrangement, and operation of the pulling wheels E E, whether provided with intermatching spokes *g g*, for cutting and crushing as well as pulling, or simply arranged for pulling, and either with or without the auxiliary cutting and cleaning knives, substantially in the manner and for the purposes specified.

I also claim the gathering wheels or rollers G G, constructed and operating as described, in combination with the pulling wheels E E.

No. 26,829.—AUGUST BICKEL, of Philadelphia, Pa.—*Improvement in Crutches*.—Patent dated January 17, 1860.—This invention consists in the combined arrangement of a series of spiral springs and an elastic strap with the top piece of a crutch, whereby the said top piece is rendered much more easy and less injurious to the user, than heretofore, and in making the lower end of said crutch elastic in the direction of its length by means of a spiral spring.

The inventor says: I *claim*, first, the springs *e e e*, and elastic strap *f*, in combination with the top piece *a*, the same being constructed, arranged, and combined together, substantially in the manner and for the purpose set forth and described.

Second. I also claim the application of the spiral spring *b*, to the lower end of the staff, in combination with the tube *b¹* and stem *c*, as and for the purposes set forth and described.

No. 26,830.—CHILLION F. BROWN, of Bridgeport, Conn.—*Improvement in Spring Rollers for Window Sashes*.—Patent dated January 17, 1860.—The engraving represents the spring roller, B is a metallic frame, to which the axis C is attached; upon this the metallic roller D revolves; E E are metallic springs, one end of each of which rests upon the cross bar F, of the frame B, and is secured to said frame by a rivet G, the springs being so shaped and attached that the whole arrangement will resemble one half of an ordinary elliptic spring.

Claim.—The combination of the frame B, in which the roller revolves with the two springs E E, substantially as described.

No. 26,831.—JAMES A. CAMPBELL, of Georgetown, Canada West.—*Improved Apparatus for Printing Addresses on Newspapers, &c.*—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Printing addresses on the margin of newspapers simultaneously with the printing of the newspapers, by means of cells or boxes i, containing the addresses set up in type and conveyed to the form, or to the bed thereof, by means of an endless apron having an automatic intermitted movement; and this I claim independently of any particular form or kind of printing press, or means employed for operating the endless apron.

No. 26,832.—JOSEPH CARLIN, of Cumminsville, Ohio.—*Improved Horse Shoe.*—Patent dated January 17, 1860.—The dovetailed tenons or shanks *b c* of the toe B and calks C, respectively, fit corresponding mortises F in the under side of the base A, with sufficient play to enable them to be secured after insertion by driving in and clenching the keys G.

Claim.—The arrangement of the projections D, cavities E, dovetails *b c* F, and wedge-keys G, constructed and combined substantially in the manner and for the purpose set forth

No. 26,833.—VOSCO M. CHAFEE, of Xenia, Ill.—*Improvement in Ploughs.*—Patent dated January 17, 1860.—C is the reversible double flange plate landside; D is the mould board and share; E is the turning plate; H the stirrup to secure the weed fender G G¹ to the beam; I is a V-shaped notch that underlaps the point of standard F; O O are bolts to secure the landside to the standard; Q, a bolt to secure the landside to the handle B.

The inventor says, I *claim*, first, the double flanged reversible cutter landside, in combination with the peculiar shaped stand D, and bolts O O and Q, substantially as set forth.

Second. I also claim the arrangement of the turning plate E, in combination with the double flanged reversible cutter landside and bolts O O and Q, or their equivalent.

No. 26,834.—VOSCO M. CHAFEE, of Zenia, Ill.—*Improved Printing Press.*—Patent dated January 17, 1860.—This invention consists in the manner of feeding the cards, distributing the ink on the rollers, imparting power to the printing apparatus, working the inking rollers, and counting the impressions.

The inventor says: I *claim*, first, the adjustable card box R, constructed and arranged substantially as described.

Second. The slide T, in combination with the catch or feed plate U, constructed and operated substantially as and for the purpose specified.

Third. The grooved wheel G, in combination with the bolt *d*, and pitman J, all constructed and operating substantially as described.

Fourth. The sliding frame F, constructed as described, and working in a line parallel to the main shaft.

Fifth. The mechanism described, or its equivalent, for the purpose of imparting to the inking rollers a double longitudinal friction against each other.

Sixth. The combination of the ratchet wheel H¹, shaft J¹, arm L¹, and graduated plate K¹, in the manner and for the purpose specified.

Seventh. I claim communicating power to a printing press by means of a combination of a cam and sliding frame, when the main shaft to which the cam is attached is in a line parallel to the line of motion of the sliding frame, substantially as described.

No. 26,835.—SYLVANUS S. CLARK, of Manchester, N. H.—*Improvement in Hay or Straw Cutters.*—Patent dated January 17, 1860.—C C are the shear or cutter bars which are jointed at their lower ends and confined to the frame A, by means of a bolt or screw rod *o*, passing through the said bars and frame. The cutter bars are jointed at their upper ends to curved connecting rods D E, the other ends of the said connecting rods being in turn jointed to the lower ends of sectoral levers F G.

The inventor says: I *claim* the combination and arrangement of the crossed and connecting rods D E, the brake L, and the sectoral levers F G, applied to the supporting frame and the shear cutters or mechanism, substantially the same,

I also claim arrangement of the sectoral arms, brake, and connecting bars above the knives C C¹, and the mouth of the hopper, as represented.

No. 26,836.—GEORGE A. COX, of Brooklyn, N. Y.—*Improvement in Formers for Bonnet Fronts.*—Patent dated January 17, 1860.—The cross piece D is attached directly to a block E, the axis of which plays in a slotted upright F, so that by means of the screw G the former A can be raised or lowered, and may be adjusted longitudinally by moving it along the slot F.

Claim.—The use or employment of the former A, in combination with the frame composed

of the parts D E and F, when arranged and operated in the manner described and for the purpose specified.

No. 26,837.—BENJAMIN F. CRAIG, of Washington, D. C.—*Improvement in Hot Air Engines*.—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The introduction into the cylinder of a hot-air engine of two separate bodies or currents of gaseous matter, one of which is much cooler than the other, and the hotter of which is controlled and limited by the action of the cooler and by the form and arrangement of the piston and cylinder to such an extent as that it does not come into contact with those working parts which its heat would injure, substantially as described.

No. 26,838.—PEARSON CROSBY, of New York, N. Y.—*Improvement in Filing Saws*.—Patent dated January 17, 1860.—This invention consists in the employment or use of a bar provided with an adjustable slide, a stationary clamp or holder in which the file is secured, and adjusting or gauge screws, the parts being so arranged that the sides of the teeth of the saw may be filed so as to form a set of equal width throughout the whole length of the saw.

Claim.—The bar A, with the slide B¹, transverse plate or file-holder C, provided with the file D, and the set screws E E, or their equivalents, to form a new and useful implement for the purpose set forth.

No. 26,839.—VALORUS DREW, of New York, N. Y.—*Improved Shade Fixture*.—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the two cords C E, connected by the ring D, and arranged as shown, to wit: the cord C, passing around the roller B, and the cord E, provided with the eye F, and attached to the jamb of the window casing, substantially as and for the purpose set forth.

Second. The sliding journal *f*, fitted in the roller B, provided with the slot *e*, so arranged relatively with the journal *f*, as to admit of the adjustment of the same for the purpose specified.

Third. Attaching the shade G to the roller B, by means of the headed elastic rod *j*, fitted in the hem of the shade and secured into the groove or recess *g*¹ of the roller by means of the staples *h*, in connection with the tape H, provided with the knot *k*, as described.

No. 26,840.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Scaffoldings*.—Patent dated January 17, 1860.—This invention is an improvement in hanging and supporting scaffolds for builders, painters, &c., so that the scaffold will be held or secured in a perfectly steady position near the building which is to be repaired, and at the same time so that the foot boards can be readily adjusted at any height required without using either ropes or nails for retaining the parts together.

Claim.—The arrangement and combination with the crossties F and poles A, of the adjustable brackets B and straps C, substantially as and for the purposes shown and described.

No. 26,841.—JOSIAH P. FITCH, of New York, N. Y.—*Improved Churn*.—Patent dated January 17, 1860.—This invention consists in providing a circular guard D, on the dasher staff just above the axis on which it swings, so that no cream shall be allowed a chance to get up into the space in which the dasher swings, and in arranging a hand rest on the handle, so that it may be adjusted to suit the height of different persons.

The inventor says: I *claim*, first, the curved guard F, arranged on the dasher shaft, and moving with the same, in combination with the peculiar shaped dasher and churn tub, in the manner and for the purpose described.

Second. The hand rest E, when made adjustable, in combination with the guard D, churn tub A, and dasher B, in the manner described.

No. 26,842.—WILLIAM FRANKLIN, of New Haven, Conn.—*Improvement in Pantaloons*.—Patent dated January 17, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the combination of upright elastic ribs with the legs of the pantaloons, by means of a lining or its equivalent, by which the ribs are secured in place, in contradistinction to attaching them directly to the material which forms the surface of the legs of the pantaloons.

I also claim the combination of hair cloth or its equivalent with elastic ribs and with the legs of the pantaloons, in such manner that the direction of the hair is crosswise to the lengths of the ribs.

No. 26,843.—LEONARD GILLETT, of North Colebrook, Conn.—*Improved Method of Raising Water*.—Patent dated January 17, 1860.—B is a suction and force pump; C the piston; D is the piston rod; E is a weight secured to the piston rod; F are valves arranged in different parts; G is the pipe through which the water is forced or elevated, and crooked at the desired point, so as to discharge the water into the bucket; I H is the lever which connects the pump with the bucket; I is the bucket suspended to the long arm of the lever H.

Claim.—The arrangement, as described, of a pump B, weighted piston E, pipe G, self-discharging bucket I, and lever H, substantially as and for the purpose described.

No. 26,844.—AUSTIN S. HART, of Buffalo, N. Y.—*Improvement in Faucets*.—Patent dated January 17, 1860.—This invention consists in the formation of a chamber in the main body of the faucet to receive the end of the supply pipe, and the arrangement of a spiral spring and valve within said chamber, and a thumb screw in the top, and over the valve, so that the spring by its expansion will open the valve, and the thumb screw be used to close the valve and contract the spring.

Claim.—The arrangement of the spring C, valve D, and pipe B, within the chamber A, and screw E, above the chamber, for the purposes and substantially as described.

No. 26,845.—GEORGE G. HENRY, of Mobile, Ala.—*Improvement in the Manufacture of Oil from Cotton Seed*.—Patent dated January 17, 1860.—This invention consists in drying the cotton seed, to facilitate the separation of the hull and kernel, passing the dried seed through a mill to crack them, and then allowing them to fall upon a sieve or bolting cloth by which the hulls are separated from the kernels, and finally subjecting the latter to a heavy pressure to extract the oil therefrom.

Claim.—The improvement in the treatment of cotton seed by which oil, oil cake, and manure are obtained therefrom, in the manner and for the purposes substantially as described.

No. 26,846.—JAMES BUCHANAN HENRY, of New York, N. Y.—*Improved Method of Rivetting Boiler Plates*.—Patent dated January 17, 1860.—This invention consists in the use of plates with marginal portions, which are to form the laps of the joints and receive the rivets of a sufficiently greater thickness than the rest of the plates to compensate for the weakening effect of the rivet holes, when said plates are so lapped, that the same rivet passes through both plates in forming a joint.

Claim.—The use of plates with an increased thickness imparted to their edges, when said plates are so lapped that the same rivet passes through both plates, substantially as described.

No. 26,847.—JACOB HIBBARD, of Hermitage, N. Y.—*Improved Feed Water Apparatus for Steam Boilers*.—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the rotating feed plug C receiving its water on one side and discharging it into the boiler on the other, the operation being performed by the continuous rotation of the plug, all in the manner and for the purpose substantially as set forth.

No. 26,848.—R. W. HILL, of Naugatuck, Conn.—*Improvement in Skeleton Skirts*.—Patent dated January 17, 1860.—This invention consists in placing an additional hoop attached in front to the lowermost hoop of a skirt made in any of the usual forms, and in the rear to one about two thirds of the height of the skirt from the bottom, cutting the intermediate hoops at an oblique angle, and attached to them at each point of intersection by a pin, or other joint allowing freedom of motion.

Claim.—Attaching to a hoop skirt, made in any of the usual forms, an additional hoop or hoops B placed obliquely to the rest, and united to them by flexible joints, substantially in the manner and for the purpose specified.

No. 26,849.—JOHN HIVELY, of Dayton, Ohio.—*Improvement in Flower Pots*.—Patent dated January 17, 1860.—This invention consists in the construction of a pot with an open bottom, provided with a flange on the inside and a loose removable bottom to lift the earth from the pot, and a wire screen fitted to the pot so as to protect the young plants.

Claim.—The combination of the pot A, flange B, and removable bottom C, either with or without the screen D, for the purposes set forth, substantially as described.

No. 26,850.—CHARLES W. KIMBALL, of Springfield, Mass.—*Improvement in Steam Gauges*.—Patent dated January 17, 1860.—This invention consists in supplying the steam gauge with an alarm, which may be set to sound, and sounded at any desired amount of pressure, and may be used either with or without a "tell tale," which indicates at any moment the highest pressure to which the gauge has been subjected since the steam was applied.

Claim.—The application to dial or clock-faced steam gauges of the cam, lever and wire, or their equivalents, for the purpose of giving an alarm, substantially as set forth

No. 26,851.—JOHN LARKIN, of Thibodeaux, La.—*Improvement in Evaporators for Sugar Pans.*—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination with and within the pan B, or its equivalent, of the two independent series of swinging steam pipes, substantially as shown and described, so that while one series is elevated to be cleaned, the evaporating process may be continued with the other series, as set forth.

Second. The combination of the horizontal pipes A C by means of the arched series of pipes *e*, as and for the purpose set forth.

Third. The arrangement of the extremities of the supply pipes D E and A A¹ to slide one over the other when the said extremities are combined with the stuffing boxes *d d*¹ *b b*¹ attached to the pan B, substantially as shown and described, whereby expansion is allowed and leakage prevented, as set forth.

No. 26,852.—WILLIAM S. MACKINTOSH, of Pittsburg, Pa.—*Improvement in Oscillating Steam Engines.*—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the within described arrangement for counteracting the pressure of the steam against the sides of the cylinder next the side pipe, by means of a piston or valve applied within the side pipe or steam chest, and connected by a system of levers with a pin, or its equivalent, arranged to press against the trunnion on the opposite side of the cylinder, substantially as described.

Second. Providing cavities near the exhaust ports of the side pipe and pipes or passages communicating between the said cavities and induction chamber, substantially as and for the purpose herein specified.

No. 26,853.—WILLIAM S. MACKINTOSH and JAMES HEMPHILL, of Pittsburg, Pa.—*Improvement in Oscillating Steam Engines.*—Patent dated January 17, 1860.—This invention consists in applying a piston, or its equivalent, to the trunnion, on the opposite side of the cylinder to that on which the steam is received, and in conveying steam to act upon the said piston or its equivalent.

Claim.—So applying the piston E in relation to the trunnion *a*, and so conveying steam to act upon the said piston that it may be forced by the pressure of such steam directly towards the end of the trunnion, to counteract the pressure of the steam against the opposite side of the cylinder, substantially as described.

No. 26,854.—CHARLES MCBURNEY, of Roxbury, Mass.—*Improved Apron for Printing Presses.*—Patent dated January 17, 1860.—This invention consists in covering the blanket with successive layers of canvas or cotton cloth and India rubber, and then covering it with an India rubber compound that will vulcanize all the materials employed.

Claim.—A blanket for printing machines, having a fibrous surface, as set forth, operating as described

No. 26,855.—THOMAS H. MCCRAY, of Pellico, Texas.—*Improvement in Presses.*—Patent dated January 17, 1860.—The key C is first inserted in one of the sets of notches *ffff* close to the inner extremity of the cam E, which is then put in motion, and forces the follower forward a distance equal to its throw or eccentricity. Then just before the outer extremity *b* of the cam escapes from the said key, another key or block is inserted in the next succeeding notches *ffff*, in front of the inner extremity of the cam, which then commences to act on it and performs another revolution.

Claim.—The combination of the keys C C, or their equivalents, movable to different notches or positions in succession with a revolving cam, substantially in the manner and for the purposes specified.

No. 26,856.—T. CATO McKEEN, of Nashville, Tenn.—*Improvement in Buoying Ships.*—Patent dated January 17, 1860.—This invention consists in furnishing the vessel with a strong metallic reservoir of a suitable capacity, which will serve to contain condensed air. The air is forced into this reservoir by suitable air pumps operated by the engine or by manual power. With this reservoir is connected a strong pipe or main, to which is attached branch pipes of any flexible material, which communicates with bags or buoys.

Claim.—The arrangement of the longitudinal main C running fore-and-aft the vessel, when employed in combination with the air reservoir A, central conducting pipe D, lateral branch pipes E, and bags F, as shown, so that the bags may be simultaneously inflated on both sides and along the whole length of the vessel, as set forth

No. 26,857.—WASHINGTON MORTON, of Friendship, Maine.—*Improvement in Reefing Fore-and-Aft Sails*.—Patent dated January 17, 1860.—This invention consists in the manner of arranging and applying a single reef line and its leading carriers *c c c*, together with respect to the reef band *b*, the foot rope *a* of the sail *C*, and the boom *B*; and in combining therewith a straining rope arranged and applied to the reef band and the boom, so as to relieve the outer carriers or leaders and their reef lines from the strain and wear of the sail while the latter is reefed.

The inventor says: I *claim* combining, substantially as described, a single reefing line and two sets of leading eyes together with one side of the sail, its reef band and front rope, the rope in such case not being carried through the sail.

And in combination or connection with the same, I claim the straining rope, arranged and applied to the reef band and the boom, substantially as and for the purpose specified.

No. 26,858.—ELI MOSHER, of Flushing, Mich.—*Improvement in Sap Conductors*.—Patent dated January 17, 1860.—This invention consists in arranging a sap conductor with two prongs or barbs *a a*, and with a sharp edge between said prongs, so that it can be driven into a tree at any place without causing any material injury to the tree, and at the same time the joint between the tree and the conductor be perfectly tight.

Claim.—A sap conductor provided with the sharp edge *B* and side prongs *a a*, as shown and described.

No. 26,859.—ADAM ODELL, of New York, N. Y.—*Improvement in Attaching Thills to Vehicles*.—Patent dated January 17, 1860.—The head of the clip-holder *A* is formed with a socket-like cavity, opening from the upper and back side of it. In this cavity is fitted the end of the thill irons *B*; these ends are cylindrical in form, and of such diameter as to nearly fill the cavity of the clip-holder, but are below the longitudinal axis of the thills, so that when in their seat in the clip-holder they form a hook-like connection, which is prevented from disengaging by means of a flat headed bolt *C*, secured by a nut and screw threads through the clip-holder, directly back of and against the cylindrical end of the thill iron.

Claim.—The use of the flat-headed bolt *C* in combination with the clip-holder *A* and thill iron *B*, made and operating in the manner and for the purposes set forth.

No. 26,860.—SAMUEL J. OLMSTED, of Binghampton, N. Y.—*Improved Machine for the Manufacture of Tin Ware*.—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, having the die-holding shaft *G* so constructed and arranged upon the step *F*, and in the slot of the standard *E*, as to allow the die *H* to be elevated or lowered, moved forward or backward and rotated, as set forth.

Second. I claim the so arranging of the shaft *J* within its supporting frame and boxes as to allow of its vertical and longitudinal adjustment, for the purposes described.

Third. I claim the rollers *R R¹ R²*, as combined with the setting down roller *Q* and the circular die *H*, constructed and operated as described, whereby I am enabled to "set down," "double seam," and "dish," or deflect the bottom of the ware at one operation and without removing the ware from the die, as set forth.

No. 26,861.—DU BOIS D. PARMELEE, of Salem, Mass., assignor to JOHN A. GREENE, of Beverly, Mass.—*Improvement in the Manufacture of Elastic Hollow Moulded Articles*.—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming, in a permanent manner, the shape of such articles, by cementing sheets made of rubber, or its equivalent, or their compounds, to form a bag of a shape approaching that of the intended article, and arranging the same in moulds provided with a mouth or opening, and forcing there through and into the bag, air or any other fluid at the ordinary temperature, substantially as set forth.

No. 26,862.—ANSON H. PLATT, of Cincinnati, Ohio.—*Improvement in Soap*.—Patent dated January 17, 1860.—This composition is composed of the following ingredients: Finely shaved bar soap, borate of soda, and a chlorinated solution of soda, Labbarraque's solution of the chloride of soda being the most convenient for use; the whole to be mixed with rain water.

Claim.—The use of the ingredients and proportions thereof for a composition for soap, substantially as described.

No. 26,863.—T. C. RICHARDS, of Milwaukee, Wis.—*Improvement in Blowers*.—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—A blower, composed of an inner cylinder and outer case, connected by leather or other flexible substance *C D*, arranged substantially as described, to form two or more chambers between them, such chambers being provided each with one or more inlet valves, to admit air from without, and with one or more outlet valves communicating with a common

discharge pipe, and the inner cylinder having a circular motion within the outer case without rotating on its own axis, all substantially as set forth.

No. 26,864.—JOHN RUSSELL, of Grampian Hills, Pa.—*Improvement in Harrows*.—Patent dated January 17, 1860.—The harrows A are made of any required size or material, and are provided with teeth on their under side; *d* represents a shield, which consists of a piece of metal, secured at one end to one of the harrows, the other end of which is bent; *a a* are bolts which pass through and secure the mitre joints of the several harrows together.

Claim.—The arrangement of triangular harrows A A A A and bolts *a a*, with the shield *d*, the whole being constructed as and for the purpose specified.

No. 26,865.—ALBERT M. SMITH, of New York, N. Y.—*Improvement in Pocket Match Safes*. Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so constructing a portable or pocket match safe, for holding matches, to be carried in the pocket, that the matches will fall down by their own weight into a position contiguous to the hole or place they are to pass out at, whereby one at time can be extracted from it without opening the safe.

Second. I claim the arrangement, in combination, for pushing the end of the match out of the safe sufficient to take hold of it.

Third. I claim so constructing it and arranging a rough surface in such close proximity to the hole or place in the safe the match is to pass out at, that, after the match has been pushed partly out, by taking hold of it with the fingers and drawing it completely out it can at the same time be brought against the rough surface in the ordinary manner matches usually are to ignite them, so as to ignite it.

Fourth. I claim the construction and arrangement for keeping the matches from coming out of the safe while being carried in the pocket, substantially as described.

No. 26,866.—KIRBY SPENCER, of Minneapolis, Minn.—*Improved Seat for Water Closets*.—Patent dated January 17, 1860.—The operation is as follows: the sliding cover is moved to one side of the aperture in the seat, and held open by the pressure of the leg of the person sitting on the seat against the projecting handle.

Claim.—The combination and arrangement of the slot F F with the projecting handles with straight and bent shanks E and G, the bent plate G G¹, the combined groove A A, formed by the rabbeting B in the front and the groove A A in the top, the plate A, the panel *h h h h*, the chamber I, and the casement F M, constructed in the manner described and represented and for the purpose specified.

No. 26,867.—EDWARD P. TORREY, of Jersey City, N. J.—*Improvement in Ice Cream Freezers*.—Patent dated January 17, 1860.—This invention consists in arranging the beater with a rigid scraper on one side and with a series of smooth inclined slats on the other, in a cylindrical can, which, by means of a socket in its bottom and by a boss on its cover, forms the proper bearings for the stem of the beater, and which is provided with legs or projections at its bottom, fitting over a crossbar in the bottom of the barrel or tub in which the can is placed.

The inventor says: I *claim* the arrangement and combination within the freezing vessel of the rigid scraper E and the inclined beating slats C, so that the cream will be cut clean from the interior surface of the can, and as fast as moved will be whipped and lifted by the inclined slats C and spread over the surface of the can, as specified.

I also claim the arrangement and combination of the crossbar F with the bottom of the tub or barrel G and the bottom of the can A, as and for the purpose specified.

No. 26,868.—HIRAM TUCKER, of Cambridgeport, Mass.—*Improved Portable Roof Covering*. Patent dated January 17, 1860.—This invention is explained by the claim and engravings.

Claim.—As a new article of manufacture, the composite waterproof roof covering described, the same consisting of a central web and layers of waterproof mixture adhering to both sides thereof, one or both of which layers are covered with a film formed by the evaporation of a wash, substantially as described.

No. 26,869.—OLIVER E. WESTON, of Roxbury, Mass.—*Improved Printing Press*.—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with the horizontally moving type bed B and platen N, (of a hand press,) of a horizontally moving frisket P, arranged and operated substantially as and for the purpose shown and described.

Second. I claim the combination of the inking apparatus and frisket P with the shaft F, substantially as and for the purpose shown and described.

Third. I claim the employment of the frisket as a "fly" for the sheets, substantially as shown and described.

Fourth. The employment, in combination with the platen and type bed, of the adjustable bearing screws m^1 , to equalize the force of the platen, as shown and described.

No. 26,870.—JOHN W. WHEELER, of Cleveland, Ohio.—*Improved Method of Elevating and Delivering Water from Wells*.—Patent dated January 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Operating the valve in the bottom of the bucket by the rear end of the trough, the lever actuating the trough being moved by the bucket, and the trough having a more rapid advance than the bucket, as set forth.

No. 26,871.—ENOS G. ALLEN, of Boston, Mass., assignor to HENRY O. ALLEN, of Malden, Mass.—*Improvement in Steam Gauges*.—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engraving.

Claim.—The use, in gauges for indicating the pressure of steam, or of other fluid, of a volute spring, the coils of which are of uniform thickness throughout, and which taper in width on one side only, in combination with the rubber disk or diaphragm, as set forth.

No. 26,872.—C. R. BELLOW, of Seneca Falls, N. Y., assignor to himself and ABRAHAM ORVIS, of Niagara City, N. Y.—*Improvement in Rope Making Machines*.—Patent dated January 17, 1860.—This invention consists in the manner of giving rotary motion to the strand bobbins, both upon their own axis and around the laying spindle.

Claim.—The arrangement of the internally toothed rack B, spur wheel D, driving shaft C, flying spindle E, toothed flanged flyers F, and bobbins d , in combination with and in the relation specified to the other described mechanism which controls the cord or rope after it is made, substantially as and for the purpose set forth.

No. 26,873.—S. G. CRANE, of Rochester, N. Y., assignor to himself and CONRAD B. DENNY, of said Rochester.—*Improvement in Friction Sash Supporters*.—Patent dated January 17, 1860.—The curvature of the spring gives it a slight projection from the edge of the sash, like the crown of an arch, while underneath a smaller curved spring c is placed, with the concave surface opposite that of b , so that their outlines produce the figure of an ellipse, and secured at one end, in the manner of b . This acts as an auxiliary to the main or bearing spring b , its free end supporting it in the centre and increasing its elasticity and force.

Claim.—The combination of the prime supporting spring b and auxiliary spring c , or its equivalent, applied to a sliding sash or window, substantially in the manner and for the purpose described.

No. 26,874.—DE GRASSE FOWLER and THADDEUS FOWLER, of North Branford, Conn., assignors to themselves, SAMUEL MALTBY, and GUSTAVUS R. ELLIOT, of North Branford.—*Improvement in Making Coated Iron Pins*.—Patent dated January 17, 1860.—This invention consists in finishing coated iron pins by a rolling and compressing operation, whereby the granules are crushed down to a perfect level and the pin rendered smooth and uniform throughout its entire length.

Claim.—Finishing coated iron pins by the rolling and compressing operation, substantially as specified.

No. 26,875.—WILLIAM H. GRAY, of Dover, N. H., assignor to LUTHER ROBINSON, of Melrose, Mass.—*Improvement in Power Looms*.—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I claim, first, the employment, in combination with an upright shaft E, geared with the yarn beam, and a spring applied to the said shaft to act upon it longitudinally, in opposition to the tension of the warp, substantially as described, of a wheel I, a lever J, carrying a pawl w , and having an inclined face v , and a fixed stop x , or their equivalents, the whole applied and operating substantially as and for the purpose specified.

Second. Attaching the roller p to the lever H, by means of an oscillating frame p^1 , substantially as and for the purpose described.

Third. The rod q , furnished with a collar u , the spring r , and the strap s , applied in combination with each other and with the lay, and the peculiarly constructed lever J, substantially as and for the purpose specified.

No. 26,876.—FREDERICK S. OTIS, of Brooklyn, N. Y., assignor to A. B. CHAPMAN, of New York city.—*Improved Clasps for the Ends of Bustle Hoops*.—Patent dated January 17, 1860.—The clasp a is applied over the hoop, the teeth 33 penetrating the galloon; the tongue Q is

then turned around to the back, inclosing the end of the hoop, and the teeth 3 3 are turned down into this tongue 2, which holds the parts firmly in place.

Claim.—The clasp *a*, formed with the teeth 3 3, to penetrate the galloon, and confine the end of the tongue 2, when bent back around the end of the bustle hoop, as and for the purposes specified.

No. 26,877.—JOHN SLOAN, of Pittsburgh, Pa., assignor to E. H. DIERKER and WILLIAM WASSELL, of said Pittsburgh.—*Improvement in Distilling Apparatus.*—Patent dated January 17, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The arrangement of the heating pipe *d*, condensing pipe *f*, conducting pipes *e f l* and *j*, stirrer *i*, and governor, in connection with the vessels *a b c* and *x*, when arranged and constructed substantially as described, for the purpose of distilling and brewing.

No. 26,878.—I. T. ALLEN, of New York, N. Y.—*Improved Bed Bottom.*—Patent dated January 24, 1860.—This invention consists in making an adjustable support rail, whereby the distance or bearing of the slats may be easily and readily changed to a greater or less distance from centre to centre, and also the length of the bars and the slats arranged and adjusted to the different widths of bedsteads.

Claim.—An adjustable elastic bedstead bottom, the crossbar *a*, angular shaped block *c*, screws *d*, or their equivalents, brackets *h*, elastic band *e*, and slats *g*, arranged substantially in the manner and for the purpose described.

No. 26,879.—C. BIXLER, of Rogersville, Ohio.—*Improved Lard Expresser.*—Patent dated January 24, 1860.—This invention consists in having a perforated box or strainer provided with a handle and having a pressure plate hinged thereto, the pressure plate being also provided with a handle which is slotted, and through which the handle of the strainer passes.

Claim.—The strainer *A*, and pressure plate *B*, connected by hinges or joints, and provided with handles *C D*, arranged as shown and described, to form a new and useful article of manufacture for the purpose specified.

No. 26,880.—D. C. BROWN, of New York, N. Y.—*Improved Churn.*—Patent dated January 24, 1860.—This invention consists in the arrangement of the two disks of wood or metal, one of which, *G*, revolves, while the other, *F*, is stationary, through and between which the fluid to be acted upon is passed. The disks have upon their inner faces a series of rings *a a a*, projecting inwards therefrom, and so arranged that the rings on the side of the disk *G* enter and revolve in the spaces between similar rings on the disk *F*.

Claim.—The disks *F* and *G*, in their combined action, having upon their inner sides the rings *a a a*, &c., all in the manner substantially and for the purpose specified.

No. 26,881.—JOHN H. BELTER, of New York, N. Y.—*Improved Bureau.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the described specific construction and union of the sides and bottom of the drawers, whereby are obtained the advantages set forth.

Second. The described manner of locking and unlocking all the drawers by the lock of a single drawer and the spring *C*, or its equivalent.

Third. The springing catches *m*, combined and arranged relatively to the rigidly locked bar *D d*, or its equivalent, substantially in the manner set forth, so as to allow a drawer or drawers to remain free at pleasure after the single lock *F* has been locked, and subsequently to lock them, in the manner and with the advantages shown.

Fourth. The described combination and arrangement of the locking devices *d m*, and of the handle *I*, with the described construction of the drawers, for the purpose set forth.

No. 26,882.—THOMAS W. BROWN, of Boston, Mass.—*Improvement in Skates.*—Patent dated January 24, 1860.—This invention consists in constructing a skate, with grooved and plain runner bars connected only at two adjacent ends and to the foot rest by projections therefrom, through or into which either runner bar may be inserted endwise, and held by screws or other proper equivalent devices, the same being so that either bar may be arranged below the other as a person may desire either for skating with the grooved or the plain runner next to the ice.

The inventor says: I *claim* an improved skate as made with a reversible runner, one of whose opposite edges is plain, or not grooved, and the other fluted or grooved.

I also claim the improved mode of constructing a skate, viz: with the plain and grooved runner bars *a b*, connected only at their two adjacent ends, or as shown at *c*, and to the foot rest, by projections or brackets *C D*, so as to be movable relatively to such foot rest and reversible, substantially in manner and for the purpose as specified.

I also claim extending each of the brackets C D, from the upper bar of the runner down to the lower bar thereof, so as to support both of said bars, as described.

No. 26,883.—R. P. BUTTLES, of Mansfield, Pa.—*Improved Animal Trap*.—Patent dated January 24, 1860.—This invention consists in so arranging the bottom of the trap in connection with vertical rods extending upward from the bottom, that the tipping of the bottom B, caused by the entrance of the animal, will release the door and close the trap.

The inventor says: I *claim* the combination of the tipping bottom, the vertical rods and the sliding door, arranged substantially as described for the purpose as set forth.

I also claim arranging the points of suspension of the tipping bottom in such position as to require the animal to enter entirely within the trap before it is sprung.

No. 26,884.—THOMAS W. CARROLL, of Baltimore, Md.—*Improved Self Lighting Lamp*.—Patent dated January 24, 1860.—A A A is a pair of levers connected at the points F F G, the middle point being a roller; B B B is a slide notched on its edge for the purpose of taking hold of the fuse, and thereby to feed or push it forward when the lamp is to be lighted.

Claim.—The application of the lever and slide, as set forth.

No. 26,885.—LYMAN A. CLARK, of Bridgeport, Conn.—*Improved Nut Cracker*.—Patent dated January 24, 1860.—This improvement consists in making the nut cracker with one stationary jaw, in the concave surface of which the nut is to rest, and one movable or vibrating jaw, which is to be forced down by a cam lever acting on an inclined plane to crack the nut, and when the cam lever is raised the vibrating jaw will be thrown up by an appropriate double spring properly attached to it.

Claim.—The combination of the cam lever with the inclined plane, when these are combined with the vibratory and stationary jaws, and the whole is constructed, arranged, and made to operate substantially as described.

No. 26,886.—E. J. CRIDGE, of Troy, N. Y.—*Improvement in Cooking Stoves*.—Patent dated January 24, 1860.—*f* and *g* are registers or dampers in the sides and bottom of the stove to regulate the admission of cold air through the opening *h h* and *i i*, to supply the chambers *a a*, the damper *g* in the bottom of the stove being regulated by damper *f*, by the cogs or notches *k k k*, so that when the damper *f* is moved the damper *g* in the bottom is also moved.

Claim.—The arrangement of the dampers or registers *f* and *g*, or their equivalents, substantially in the manner and for the purpose set forth and described.

No. 26,887.—JOHN E. CRANE, of Lowell, Mass.—*Improvement in Wire Screens for Cleaning Cotton*.—Patent dated January 24, 1860; antedated July 24, 1859.—The claim and engravings explain the nature of this invention.

The inventor says: I wish it to be understood that the improvement in cotton cleaning trunks which I have invented, and desire to secure by letters patent, consists in the use of metallic screens in said trunks, when the said screens have been manufactured in such a manner as to remove the cracks, scales, and other adhesive roughness from their surfaces, substantially as set forth.

No. 26,888.—THOMAS CONNELLY, of Philadelphia, Pa.—*Improvement in Burners for Vapor Lamps*.—Patent dated January 24, 1860.—This invention consists of a plate *m*, so arranged within the flaring chamber *f*, as to form, with the latter, a narrow annular space through which the vapor must pass in a thin stream, exposed to the hottest part of the said chamber, thus imparting additional heat to the vapor and tending to reduce it to the best condition for illuminating purposes.

The inventor says: I *claim*, first, the combination of the annular perforated tube A, with the outer vapor tube G, its flared chamber *f*, and inner vapor tube D, when the said tubes are arranged in respect to each other and to the annular tube A, substantially as and for the purpose set forth.

Second. The plate *m* attached to the inner tube D, and arranged within the chamber *f* of the tube G, as specified.

No. 26,889.—WILLIAM CHESTERMAN, of Centralia, Iowa.—*Improvement in Coffee Pots*.—Patent dated January 24, 1860.—The object of this improvement is to arrange the pot so that the grindings can be taken out without the danger of mixing some of them with the liquid coffee, and this object is obtained by arranging the piston packed strainer in a separate movable cylinder, which can be withdrawn whenever it is desired. The air tube, which admits air to the pot, is covered by the same cover that covers the spout.

Claim.—The arrangement of the movable cylinder C, in combination with the pot A, cylinder B, and piston packed strainer F, substantially as and for the purposes described.

No. 26,890.—HENRY L. CAKE, of Pottsville, Pa.—*Improvement in Coal Screens.*—Patent dated January 24, 1860.—The invention consists in having the screen formed with one of its two series of bars, "broken" or "staggering;" that is to say, intersecting their cross-bars, or the bars of the other series, at such points that the row of "staggering" bars between two of the unbroken or continuous ones will be in line with the centres of the spaces between its adjoining rows.

Claim.—Casting the screen with "broken" or "staggering" bars B, and continuous bars A, substantially as and for the purpose set forth.

No. 26,891.—GEORGE N. CUMMINGS, of Meriden, Conn.—*Improved Catch for Spectacle Cases.*—Patent dated January 24, 1860.—This invention consists in producing two indentations with a proper tool, one in the forward part of the rim of the cover and struck from the inside so as to produce a protuberance on the outer surface, and the other of like character, also from the inside upon the rim of the box part.

Claim.—Forming a snap for metal boxes, such as spectacle cases, tobacco box, &c., by making corresponding indentations on the rim of the lid and on the side of the said boxes, in the manner and for the purpose set forth.

No. 26,892.—ISAAC T. CARPENTER, of Martin's Ferry, Ohio.—*Improvement in Machines for Grinding Apples.*—Patent dated January 24, 1860.—To grind apples the cylinders C C¹ are made to revolve with different velocities, one moving considerably faster than the other, so as to mash and also tear the apples as much as possible. The cylinders are made of wood and covered with a thin metallic sheeting *a a*¹, which is punched with a great number of small holes, the rough and ragged projections of which will constitute the grinding surface of the cylinder.

Claim.—The application of a grater or metallic sheeting *a a*¹ to the cylinders C C¹, said sheeting being perforated or punched with small holes, the rough and ragged projections of which are placed externally and constitute the grinding surface of cylinders C C¹.

No. 26,893.—JOHN DONALDSON, of Rockford, Ill.—*Improved Separator for Hominy Mills.*—Patent dated January 24, 1860.—The object of this invention is to separate the hulls from the cracked or broken grain as the latter is discharged from the cracking apparatus, and consists in the employment or use of a fan and blast spout, screens, and a rigid and flexible board, arranged relatively to each other and the discharge opening of the stationary cylinder or shell, so as to effect the desired result.

Claim.—The arrangement of the vibrating board *f*, vibrating screen *i*, vibrating elastic board *g*, shell A, fan B, and screen *j*, as and for the purpose shown and described.

No. 26,894.—GEORGE W. PITTMAN, of Bushwick, N. Y., assignor to himself and WILLIAM C. BOONE, of said Bushwick.—*Improvement in Machinery for Laying Rope.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting two flyers in line by a central hollow journal, substantially as described, in combination with an arrangement of guides, substantially such as described, so as to carry the first strand from the first to the second flyer in a diagonal line, crossing the axis of rotation, whereby the several strands can be carried to the top with equal twist, as set forth.

No. 26,895.—CALEB S. DAVIS, of Harrisburg, Pa.—*Improvement in Machines for Finishing Cotton Goods.*—Patent dated January 24, 1860.—This invention consists in the peculiar arrangement of emery rollers, with partitions, in dirt chambers for cleaning and removing knots and dirt from cotton cloth, and in the arrangement and use of movable iron stretchers, each with right and left hand threads, for the purpose of laying the nap on the cloth and preserving its original width; also, in the application of steam by means of a steam chamber and calender roller for alternately dampening, bleaching and pressing, smoothing and drying the cloth.

The inventor says: I *claim*, first, the arrangement of the emery rollers and the cylinder brushes with the calender rollers, when either calender roller is filled with steam, substantially as and for the purposes specified.

Second. I claim the iron movable stretchers, the partial partitions in the dirt chambers, and the steam chamber into which passes a perforated pipe for the purpose of infusing steam into said chamber, the same being arranged substantially as and for the purpose specified.

Third. I claim the arrangement of the emery rollers with the partial partitions in the dirt chambers.

No. 26,896.—JACOB DUTCHER, of Gibson, Pa.—*Improvement in Self Acting Wagon Brakes*.—Patent dated January 24, 1860.—To the front axle A, and near each end of it, a rack E is attached; to the inner side of each rack E, a vertical plate F is attached. The plates are slotted longitudinally, and form guides for a shaft G, which is fitted in bearings b, at the back ends of brace rods c c, at the back part of the draught pole H. At each end of the shaft G there is a pinion c¹, and the pinions gear into the racks E E.

Claim.—The combination, with the pole H and axle A, of the racks E E and pinions c¹ c¹ as and for the purpose shown and described.

No. 26,897.—E. WOLCOTT DANIELS, of Springfield, Mass.—*Improvement in Machines for Picking Millstones*.—Patent dated January 24, 1860.—On the guide h a bar N is placed and allowed to slide freely; to this bar N a bar O is attached at right angles, and to the outer end of bar O, and to the bar g of frame L, a bar P is attached at right angles, and consequently parallel with N; in the bar O two screw rods Q Q are placed, which work in nuts R R, one of which is attached to the upright e, and the other to the upright f of frame L.

Claim.—The combination with the frame L of the additional frame, consisting of the bars N O P, and the shaft R, locking device l, pinions g g m m, and screws Q Q, arranged and operating substantially as described, for the purpose specified.

No. 26,898.—LINSON DE FOREST, of Derby, Conn.—*Improved Method of Manufacturing Wooden Mosaics*.—Patent dated January 24, 1860.—This invention consists in forming a composite block by cementing together slabs or blocks of regular or irregular geometric form of different varieties or color of wood, and then sawing or cutting the block into pieces and moving or sliding these pieces on each other a greater or less distance, so as to change the relation the different woods originally bore each other, and then cementing these pieces together, and cutting or turning the secondary block thus made to the required form.

Claim.—The method of arranging, dividing, rearranging, and uniting woods of different descriptions or different colors, substantially as described, for the purpose as set forth.

No. 26,899.—ELISHA F. EDWARDS, of Le Roy, Ill.—*Improvement in Wind Mills*.—Patent dated January 24, 1860.—When the mill is in operation the springs are wound up to the desired tension, the ratchets retaining them at the proper tension. If the breeze becomes stronger than desired, the portion of each sail which is furthest from the arm, on which it is free to turn, is forced round, and the edge of the sail thus presented more and more to the wind. The fusees e e e, from their structure, give the wind the advantage in deflecting the sails, and the spring in restoring them to their place again.

Claim.—The arrangement of sails a a a a, substantially as described, with the spiral springs, fusees, rods, and cords, in the manner and for the purpose specified.

No. 26,900.—HENRY W. FARLEY, of Hannibal, Mo.—*Improvement in Pressure Gauges*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The lever L and weight W, or their equivalents, in combination with Burdon's pressure gauge spring S, in such a manner that the effect of any jar or external force upon the tube or spring S, when in action, shall, in all positions of the spring, be counterbalanced or neutralized by the effect of the same jar or external force upon the weight W, and the tube or spring be thus left to act undisturbed save by the pressure which is to be indicated, measured, or regulated by the gauge, thereby securing a more perfect operation of the gauge and constant correctness of the indicator.

No. 26,901.—WILLIAM L. GOLD, of Allegheny, Pa.—*Improvement in Steam Engines*.—Patent dated January 24, 1860.—This invention consists in so arranging and constructing the cranks or arms of the lifters and cam rods of puppet valve engines that they may be operated and handled with ease and speed by means of levers and connecting rods.

The inventor says: I *claim*, first, the flanges i on the reversing crank or arm h, and the projection t on the cam rod e, when used for the purpose of guiding the hooks 1 and 2 into their proper position on the wrists 3 and 4 of the reversing crank or arm h, as described and set forth.

Second. The use of the link m, or its equivalent, when used in connection with the cam rods f and g, reversing crank or arm h and the crank or arm l, as described and for the purpose set forth.

Third. The use of the connecting rods o and g, or their equivalents, when used in combination with the link m, cam rod e, and levers p and r, as described and for the purpose set forth.

No. 26,902.—SOLOMON S. GRAY, of Boston, Mass., assignor to himself and S. A. Woods, of said Boston.—*Improved Planing Machine*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the feed rollers Q R, and bed B, when used in connection with the mechanism composed of the shaft L, provided with the pinions D f, and the lever O, provided with the pinions g, and the pinion l, on the roller R, arranged substantially as shown, so that, by a simple adjustment, either the feed rollers Q R, or the bed B, may be driven as occasion may require.

I further claim the manner, as shown, of attaching the roller frame P to the machine, to wit, by means of the joint or pivot k, so as to facilitate the adjustment of the rollers Q R, as specified.

No. 26,903.—JOEL B. HAYDEN, of Easton, N. Y.—*Improved Boot and Shoe Soles*.—Patent dated January 24, 1860.—This invention consists in making the entire outer sole for boots and shoes of sheet steel, formed and tempered so as to possess all the yielding qualities necessary for ease in wearing.

Claim.—The application of tempered steel for the outer soles of boots and shoes, as described.

No. 26,904.—WILLIAM WHEELER HUBBELL, of Philadelphia, Pa.—*Improvement in Projectiles for Fire-arms*.—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: First. I *claim* the construction of the holes k, and the diagonal holes j, so as to discharge the gas tangential to the cylindrical surface of the projectile, protected by the rear cylindrical surface m, and in this manner rotate the projectile in the gun without increasing the ordinary windage, as described.

Second. I claim forming the circular recess i, from the mouth of one diagonal hole j, to the other entirely around them, in combination with the holes k, and the cylindrical surface m, so as to facilitate the rotation in the gun in this manner, as described.

Third. I claim constructing the holes k and j, so as to discharge the gas tangential to the circumference opposite the corresponding faces d on the front, as shown, so as to have their reactive force of gas to coincide with the resistance of the faces, and in this manner operate with them to rotate the projectile in the same direction without rear grooves or increase of windage in the gun.

Fourth. I claim the expansible band m n, secured by the recess o, and flange p, on the back part of the projectile, or its equivalent, in combination with the vents j, so that the closing of the windage, by the band or ring behind the vents, shall compel a greater flow of gas to pass through the vents j, and increase their rotative action, as described.

Fifth. I claim the combination of the radial surfaces c, the curved surface d, the sectional surfaces a, and the cylindrical body f, with the flat rear h¹, so as to cause the longest practicable bearing and the least shake or angular position of the projectile in the gun and the rotation, and by this steady position and rotative action acquire a true line of flight.

Sixth. I claim the extension of the carrying cylinder r r to the back part of the projectile, in combination with the metallic striker x, the spaces 4 4 4 4, Fig. 8, and the rear side orifices v, so as to allow the projectile time to penetrate and the striker to effect its explosion.

Seventh. The flat sides or open spaces 4 4 4 4, Fig. 8, between the striker and the cylinder to allow the air to pass through from rear to front and front to rear of the striker to facilitate its effective action in the cylinder.

Eighth. The seat of lead u, at the base of the cylinder, to receive the striker as it recedes to the back part of the cylinder, and, by its non-elastic nature, prevent a reaction of the striker in the cylinder when the projectile starts in the gun.

Ninth. I claim the fulminate in the front end of the striker, in combination with the cylinder, the tube w, the chamber g, and the spaces 4 4 4 4, Fig. 8, so as to carry the fulminate in the gun and cause it to explode the shell with certainty and ease on penetration, as described.

Tenth. The combination of the firing vents v v, in the rear of the cylinder with the magazine of powder y, in the striker, so that the striker, when it explodes the fulminate in the front of the cylinder, shall discharge a body of fire back in the cylinder, and through these firing vents to explode the shell after a sufficient time has elapsed to allow it to penetrate.

Eleventh. I claim the wooden cylinder seat s, in combination with the cylinder and striker, to steady the cylinder and receive the striker when starting in the gun; and also, I claim the auxiliary magazine of powder t, in the cylinder seat, in combination with the striker, to facilitate the firing of the contents of the shell through the vents v v.

Twelfth. I claim the point of metal e, in front, in combination with the cutting edges b, the radiating faces c, the curved faces d, and the sectional surfaces a, so as to rotate and present the point foremost against an object, first puncture it at the centre, and then cut and part it with the cutting edges and surfaces to enable the projectile the more readily to penetrate an iron vessel.

Thirteenth. I claim the combination of the lead filling n, with the copper band m, to prevent the leading of the gun when closing the windage, as described.

Fourteenth. I claim the combination of the two opposite lead screws 2 2, with the cylinder and the striker forward of the centre of gravity of the striker, so as to secure and release and allow the striker to operate without impinging on the cylinder as it is released, and without obstruction from the severed lead as it plunges forward, as described.

Fifteenth. I claim the peculiar construction of the projectile consisting of the combination of the point *e*, the cutting edges *b*, the radial faces *c*, the curved faces *d*, the sectional faces *a*, the cylindrical body *f*, the recess *i*, the rotating vents *j*, and the flat rear *h*¹, forming one projectile capable of rotating in a smooth bored gun, and acquiring initial velocity with diminished shake, of increasing its rotation in its flight, and of increased penetrative power.

No. 26,905.—DANFORTH JOHNSON, of Chicago, Ill.—*Improvement in Springs for Railway Cars, &c.*—Patent dated January 24, 1860.—This invention consists in producing or constructing a spring which is generally endless or circular in form, and which is composed or made up of one or more leaves, arranged or laid upon each other, and to which power or pressure is applied from within to elongate it.

The inventor says: I *claim* the spring A, composed or made up of one or more leaves, arranged or laid upon each other as described, when the power of pressure from within such circle is applied to elongate it, substantially as and for the purposes set forth.

I also claim, in combination with such spring, the use and application of the head blocks or parts B C, or their equivalents, to elongate such spring, as and for the purposes set forth.

No. 26,906.—A. F. JOHNSON, of Boston, Mass., assignor to ALFRED B. ELY, of Newton, Mass.—*Improved Stitch.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The stitch described, consisting of a chain stitch, having a binding thread passed through its loops, for the purpose described.

No. 26,907.—CHARLES L. KELLING, of Mechanicsburg, Pa.—*Improvement in Preserve Can Covers.*—Patent dated January 24, 1860.—This invention consists of a flanged annular plate, which is constructed with ratchet teeth, lugs, one or more raised beads, and one or more circular grooves or recesses between its inner and outer circumferences, in combination with a disk, which has a series of inclined planes, a groove, and one or more beads, and a spring pawl.

Claim.—A flanged annular plate A, which is constructed with ratchet teeth C, lugs *a a*, one or more raised beads D G, and one or more circular grooves or recesses E H, between its inner and outer circumferences, in combination with a disk I, which has a series of inclined planes *ff*, a groove *e*, and one or more beads *b d* and *a*, spring pawl J, or its equivalent, substantially as and for the purposes set forth.

No. 26,908.—JULIUS KING, of Hoboken, N. J.—*Improvement in Valve Gear for Steam Engines.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, with the movable toes H I attached, as set forth, to the valve rockshaft and sleeve, of two eccentrics B C, arranged at right angles to each other, or thereabouts, on the crank shaft, or its equivalent, and having their rods connected with the rockshaft by means of a movable yoke D, rod E, and arm F, and controlled by a guide block *r* and guide *d*, or their equivalents; the whole operating as described for the purpose specified.

And I also claim combining the eccentric yoke D with the movable toes H I, by means of the arms H² I², links *h i*, nut *e*, screw *f*, rods *l n*, and lever K; the whole applied and operating as set forth, to preserve a proper relation between the eccentric yoke and the toes.

No. 26,909.—JOSEPH KOHNLE, of New York, N. Y.—*Improvement in Pianoforte Action.*—Patent dated January 24, 1860.—This invention consists in effecting the repeat of any of the usual actions by securing to the jack an additional upright containing a pivoted button and a spring in such a manner that the hammer but, when elevated, should be mainly supported by the said spring, and thereby cause an instantaneous transmission of every vibration of the keys to the hammer; also, in regulating the catching of the hammer but on the pivoted button, by forming the second knuckle of the hammer but with adjustable screw nuts.

The inventor says: I *claim*, first, the additional upright C, containing the pivoted button B, and the spring D, attached to the jack of any of the usual actions, in the manner and for the purpose substantially as described.

Second. The construction of the second knuckle F of the hammer but, consisting of separate and adjustable nuts and screws, substantially as represented in Figs. 2, 3, 4, and 5, for the purpose set forth.

No. 26,910.—JOHN K. LEEDY, of Woodstock, Va.—*Improvement in Lamps*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the alcohol lamp B, the oil lamp D, and the water cup E, said cup being provided with one and the lamp D with two independent tubes which pass through them; the cup being situated above the lamp D, and connected with it by means of a steam pipe *d*, which passes into the tube *g*; the whole being used substantially as and for the purpose specified.

No. 26,911.—ROBERT H. LONG, of Philadelphia, Pa.—*Improved Arrangement of Steam Engines for Propelling Street Passenger Cars*.—Patent dated January 24, 1860.—This invention consists in placing a small engine and boiler upon the front platform of a passenger railway car, and in so constructing the engine as to bring the shaft on a horizontal line parallel with the car axle.

The inventor says: I *claim*, first, placing a steam engine and boiler, constructed and arranged as described, on the platform of a city passenger railroad car, in a manner substantially as specified.

Second. Placing the pinion F upon the frame of the engine, thus permitting the engine to be brought close to its work, and the whole to be used in combination with the city passenger railroad car for the purposes set forth.

No. 26,912.—WILLIAM LOYD, of New York, N. Y.—*Improvement in Stereoscopic Instruments*.—Patent dated January 24, 1860.—This invention consists in the use of a belt of linen or other suitable fabric for the reception of the pictures, and in the adaptation of such a belt and of the prism, on which it is supported and revolves, to the exhibition of transparent as well as of opaque pictures.

The inventor says: I *claim*, first, the use in an instrument for the exhibition of stereoscopic pictures, of a belt formed as described, of leather, linen, or any suitable woven, felted, or laid fabric.

Second. Making the prism of a stereoscopic instrument of glass or other transparent material, substantially as and for the purpose described.

No. 26,913.—IRA LEONARD, of Lowell, Mass.—*Improved Table Mat*.—Patent dated January 24, 1860.—The inventor says: I construct my mat by taking a plain sheet of metal, and first cut it to any desired form, and then pass it through a machine that will bend it back and forth or crimp it in regular corrugations, so that when it is laid upon the table each corrugation shall touch it only by a single line through its length.

Claim.—A corrugated table mat, for the purpose and substantially as described.

No. 26,914.—ROBERT O. MELDRUM, of Griffin's Mills, and AMOS B. PAXSON, of East Hamburg, N. Y.—*Improved Clothes Wringer*.—Patent dated January 24, 1860.—The operation is as follows: Motion being given to the endless apron and rollers, as described, the clothes are taken piece by piece from the tub, and spread upon the apron, which carries them to the rollers D H, in passing between which the water will be pressed out of the clothes.

Claim.—The arrangement of the elastic pressure roller D, spring F, roller H, the side pieces J J, rollers I I, and endless belt or apron L, for the purposes of a clothes dryer, substantially as set forth.

No. 26,915.—SAMUEL G. MARTIN, of South Amboy, N. J.—*Improvement in Reefing Fore-and-Aft Sails*.—Patent dated January 24, 1860.—The object of this invention is the reefing of fore-and-aft sails with great rapidity, and the perfect securing of the reefs, the reefing being performed at the same time that the sail is lowered, and not following the lowering as is now generally practiced.

Claim.—Reefing the sails of fore-and-aft rigged vessels by the arrangement of reefing lines and other operative means named, substantially as set forth.

No. 26,916.—GEORGE N. MUNGER and GEORGE MUNGER, of New Haven, Conn.—*Improvement in School Slates*.—Patent dated January 24, 1860.—This invention consists in applying to the ordinary wooden school slate, or to slates without frames, a piece or pieces of India rubber, cord or cork, so that said material will project from the surface of the slate or frame in such a manner that when the slate is placed on any plane surface the India rubber will rest upon this surface instead of the frame or face of the slate.

Claim.—Protecting the surfaces of slates by the use of India rubber, cord, or other suitable material applied to the frame, or to the edge of a frameless slate, substantially in the manner described.

No. 26,917.—WILLIAM McCORD, of Sing Sing, N. Y.—*Improvement in Hay Presses*.—Patent dated January 24, 1860.—This invention consists in arranging in the front part or head of the press box, in connection with an ordinary follower, a hinged gate or packer, and operating the same by means of levers, so as to pack the hay or cotton in the box and against the follower as the filling proceeds, the follower being alternately fixed and moved back by hand during this operation.

Claim.—The packing head G hinged to the press box, and operated by lever K, in combination with follower D, when the same are all arranged so as to operate substantially in the manner, for the purposes and upon the principles set forth.

No. 26,918.—SAMUEL RUFUS MASON, of Philadelphia, Pa.—*Improvement in the Ventilation of Bulk Windows*.—Patent dated January 24, 1860.—This invention consists in providing the windows with an inner sash or door to separate therefrom the interior of the store or room, and to make such opening at the bottom and the top of said window as will allow a current of air from the outside to pass up against the window, which will prevent the formation of moisture, frost, &c., on the inside of the window.

Claim.—The combination of the inlets E H², outlets F, and interior sash or door M, with store bulks or other windows, substantially in the manner and for the purposes as described.

No. 26,919.—WILLIAM HOPKINS MORRIS and CHARLES LISTON BROWN, of New York, N. Y.—*Improvement in Repeating Fire-Arms*.—Patent dated January 24, 1860.—The claim and engravings will explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement and combination of the chambers c, whether movable or fixed, the plate F, and bolt H, substantially as and for the purpose shown and described.

Second. The arrangement and combination of the revolving pin I, bolt H, hammer G, and plate F, substantially as and for the purpose shown and described.

Third. The employment, in combination with a barrel A, of a cone-shaped piece B, having several passages a a starting from the base of said cone, and converging so as to discharge into the barrel A, substantially as and for the purpose shown and described.

Fourth. The combination, with the cone-shaped piece B, of a cylinder C, having chambers c c, substantially as and for the purpose shown and described.

No. 26,920.—RICHARD B. PULLAN, of Cincinnati, Ohio.—*Improvement in Furnaces*.—Patent dated January 24, 1860.—This invention relates to a series of furnaces, arranged in such manner that the smoke and gases from the first furnace may pass over the burning coke of the other furnaces and be perfectly consumed.

The inventor says: I *claim* the mutual arrangement of the furnace E with the coke furnaces F and P, each operated in the manner and for the purpose set forth.

I also claim a rotary fire bed, constructed and arranged in such manner that coals resting thereon, after having been charred in a front or first furnace, may be transferred to a second furnace by the rotary motion of the fire bed, substantially as and for the purposes set forth.

No. 26,921.—JOHN L. POTT, of Pottsville, Pa.—*Improvement in Hoisting Apparatus*.—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The sliding frame H, with its pulleys J and J¹ combined with the drum G, and so actuated by the screw shaft F, or its equivalent, as to control the position of the folds of the rope round the drum, in the manner and for the purpose specified.

No. 26,922.—BENNETT POTTER, JR., of Hubbardston, Mass.—*Improvement in Gun Powder Mills*.—Patent dated January 24, 1860.—The shaft G is connected by means of the gearing I K L M, with the driving shaft E, and is so revolved as to lift the material which is exposed to the action of its blades, and raise it from the bottom to the top of the hopper A, and as the hopper at the same time revolves, the blades H of the stirrer are brought constantly to bear upon fresh portions of the material, no part of which is suffered to remain undisturbed.

Claim.—The inclined revolving stirrer, in combination with the revolving hopper, operating in the manner substantially as set forth.

No. 26,923.—EBENEZER G. POMEROY, of New York, N. Y., assignor to J. B. and W. W. CORNELL & Co., of said New York.—*Improvement in Smelting and Refining Iron*.—Patent dated January 24, 1860.—The claim explains the nature of this invention.

Claim.—The use of the ores of zinc, or the pure metal itself, in iron furnaces, at the same time that jets of steam or water are discharged into said furnaces, substantially in the manner and for the purposes set forth.

No. 26,924.—ADOLPH RODA, of Rochester, N. Y.—*Improved Bedstead Fastening*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The wrench lever A, with flat reverse and inclined obverse surfaces, turning on a centre in the mortise of the post, in combination with the hooked bar or bolt B, when immovably attached to the rail, and arranged to draw at right angles with the plane of the motion of said wrench, substantially in the manner and for the purposes set forth.

No. 26,925.—WILLIAM RICE, of Philadelphia, Pa.—*Improved Curtain Fixture*.—Patent dated January 24, 1860.—This invention consists in the arrangement of a pulley *f* on the blind roller, two other pulleys *i i*, and an endless band, the pulleys being covered with yielding material, and turning in fixed centres, so as to retain the blind in any position to which it has been raised or lowered.

Claim.—The arrangement of the pulley *f* on the blind roller, the pulley *i i*, and the endless cord G, when the whole of the pulleys turn on fixed centres, and when they are covered with gum elastic or other yielding material, as and for the purpose set forth.

No. 26,926.—ANDREW J. RITTER, of Rahway, N. J.—*Improvement in Attaching Thills to Vehicles*.—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The combination of the clevis C and the thumb screw D with the shaft eye K and the half journal box H, (which is secured to the axle of the vehicle,) the parts K and H being so constructed that when the clevis C, which is secured to the shaft eye by the bolt and nut E F, is in the position shown in Figs. 1 and 2, the parts K and H will be coupled together; but when the thumb screw D is loosened, and the bottom of the clevis C is pulled forward and upward toward B, the parts K and H will be uncoupled.

No. 26,927.—WILLIAM RICE, of Philadelphia, Pa.—*Improved Steam Generator*.—Patent dated January 24, 1860.—This invention consists of a box covered above and below with perforated or wire gauze plates *f h*, and containing an annular double cone-shaped gas chamber, with an annular perforated gas pipe K and a central double cone-shaped gas chamber L, the whole arranged and combined with the inner and outer casing C A and the vents *x x*, so as to form an apparatus by means of which gas may be economically applied to the generation of steam.

Claim.—The box G, its perforated wire gauze plates *f* and *h*, the annular double cone-shaped gas chamber H, its annular perforated gas tube K, and the double cone-shaped chamber L, when the whole is combined with and arranged in respect to the inner casing C and outer casing A, and vents *x x* of the generator, as and for the purpose set forth.

No. 26,928.—H. H. RICHARDSON, of Barre, Vt.—*Improvement in Water Wheels*.—Patent dated January 24, 1860.—The nature of this invention will be understood by reference to the claim and engravings.

The inventor says: I *claim* graduating the respective streams of water and projecting the same upon the buckets from chutes, of substantially the within described shape, when the said chutes are so combined with the pivoted gates *h k* as to obtain the maximum of effect, substantially as described and for the purposes set forth.

In combination with the above mentioned form of chutes and gates, I also claim constructing the bucket wheel with the branching arms and disk-shaped floats, substantially in the manner and for the purpose set forth.

No. 26,929.—JOHN ROUX, of New York, N. Y.—*Improvement in the Manufacture of Siccativ Oils*.—Patent dated January 24, 1860.

The inventor says: I take one ounce of nut galls, or eight ounces of powdered oak bark and boil it two hours in four pounds of water. I then filter the solution so made and, adding one gallon of fish or whale oil, boil the whole for one hour. After the compound has cooled I separate the oil from the water, and the solid matter formed during the boiling, and put into the oil a solution of sulphate of copper.

Claim.—The mode or method or chemical process by means of which I can give the common fish or whale oil the drying and other qualities now only found in vegetable oils, and which have heretofore rendered them preferable and of superior value for painting and other similar uses.

No. 26,930.—MAHLON REEDER, of Philadelphia, Pa.—*Improved Apparatus for Preserving and Discharging Malt Liquors*.—Patent dated January 24, 1860.—This invention consists in the application, for preserving and discharging malt liquors, of a vessel A, furnished with suitable cocks M N and a tightly packed piston D, so operating that the malt liquor may be retained within the vessel free from contact with the air at all times, and so that it may be discharged from the vessel in small quantities.

Claim.—The application, for preserving and discharging malt liquors, of a vessel furnished with a suitable cock or cocks, and a tightly packed piston, operated substantially as described for the purpose specified.

No. 26,931.—GEORGE W. ROBERTSON, of Philadelphia, Pa.—*Improvement in Hydrants.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Dividing the space between the casing of the hydrant and the water pipes into two chambers by means of the partition *h*, the upper chamber terminating in a plate *g*, and filled with a non-conducting material, and the capacity of said chamber being increased by means of the large bore *f* and space *f*¹, while the lower chamber, formed between the partition *h* and the bottom board *k*, contains no non-conducting material, but is fitted with an adjustable face board *a*¹, the whole being constructed in the manner and for the purposes set forth.

No. 26,932.—RICHARD A. STRATTON, of Philadelphia, Pa.—*Improvement in Machines for Polishing Leather.*—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Attaching the agate to a vibrating arm *J*, which is so controlled by an eccentric *K*, or its equivalent, operated by and moving simultaneously with the shaft which imparts the vibrating motion to the arm, that the agate is depressed to the curved bed of the machine during the inward movement of the arm, and raised from the bed during its outward movement, as specified.

No. 26,933.—J. HERBERT SHEDD and WILLIAM EDSON, of Boston, Mass.—*Improvement in Railroad Switches.*—Patent dated January 24, 1860.—The nature of this invention will be understood by the claim and engravings.

Claim.—The arrangement or device of deflecting one track from its true line, and putting permanently in the true line of that track the beginning of another line of track, substantially as described and shown by the drawing *A*, for the purpose of taking advantage of the tangential or right line of motion of a car or engine for conducting the car or engine from one track to the other.

No. 26,934.—FRANCIS B. SCOTT, of Buffalo, N. Y.—*Improvement in Ditching Machines.*—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the shields *B* at the side of the excavator wheel, as described.

Second. Attaching the clearers, which pass through the spades, to an endless chain.

Third. The clearers, which clear themselves by being raised up through a slot or before a scraper by rollers or slides attached to the clearers, which run on an inclined plane or in a cam, substantially as specified.

Fourth. Making the frame in two parts, with hinge joints and centre shaft on line with hinge joints and the curved rack, for the purpose specified.

Fifth. The combination of the toothed rack *T T* with the excavator, for the purpose of a gauge on the surface to determine the line of descent of the bottom of the trench, substantially as described.

Sixth. The combination of the V-shaped scraper *x* with the excavating wheel *A*, substantially as specified.

No. 26,935.—JONATHAN SMITH, of Dorchester, Mass.—*Improvement in Attaching Bonnets to Sails.*—Patent dated January 24, 1860.—In attaching the bonnet to the jib the knob is turned sufficiently to introduce the knob through the oval hole *A*, when it returns to a position across the hole of the oval grummet, thereby preventing it from coming out.

Claim.—The oval form of the grummet and the form of the knob attachment, and method of using them, as adapted to jibs or other sails.

No. 26,936.—LEVI S. TAYLOR, of Lamoille, Illinois.—*Improved Clevis for Attaching Whiffletrees to Vehicles.*—Patent dated January 24, 1860.—This invention consists of the clevis *J*, for attaching the whiffletree to vehicles, constructed with a cam catch *H*, so that the pin *I*, after being placed therein and simply turned, the lower end, by its *T* shape, entering a transverse oblong slot *K* in the lower part of the clevis, the upper end will come between the cam *O* and catch on the upper part, which, by the spring of the clevis itself, will effectually hold the pin to the clevis.

Claim.—The clevis, or its equivalent device, constructed substantially in the manner described and for the purposes fully set forth.

No. 26,937.—REUBEN TOWER and GEORGE E. TOWER, of Ashtabula, Ohio.—*Improved Water Gauge*.—Patent dated January 24, 1860.—The water in the vessel C being always on a level with that in the boiler, causes the vessel to fall and rise by the increase and diminution of its quantity, as the water rises and falls in the boiler, and thus to operate the index *f*, and show the quantity of water in the boiler.

Claim.—The gauge composed of a vessel C, suspended on springs and connected with a boiler by flexible pipes D E, and with an index by a rack and pinion, or their equivalent, and operating substantially as described, to show the condition of the water level in the boiler.

No. 26,938.—JASPER VAN WORMER, of Albany, N. Y.—*Improvement in Stoves*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of an air chamber whose perforated air-delivering surfaces or edges *f z f* shall be formed into recesses, with salient points projecting towards the centre of the throat of the fire chamber, for the purpose of obtaining the largest space for the passages of gases from the fuel, in combination with the proper supply of air, to secure the most perfect combustion of the unconsumed gases and fuliginous matter, substantially as set forth in the above specification.

No. 26,939.—LEONARD J. WORDEN, of Utica, N. Y.—*Improved Fastening for Shoe Laces*.—Patent dated January 24, 1860; antedated January 3, 1860.—This invention consists in providing a metallic slide or fastening, so constructed that shoe laces are secured at the top of the shoe.

Claim.—Securing shoe laces, in the manner set forth, by the use of the metallic fastener A, when constructed and applied in the manner and for the purpose substantially as set forth.

No. 26,940.—CALVIN D. WHEELER, of New York, N. Y.—*Improved Belt Punch*.—Patent dated January 24, 1860.—This invention consists in combining and arranging with a common punch an adjustable point C and scale D, to enable a person to adjust easily the punch to cut the holes equi-distant for any sized belt or other material to be perforated.

Claim.—The sliding rule provided with a measuring point, as described, in combination with a punch, substantially as set forth.

No. 26,941.—JOHN A. WADSWORTH, of Providence, R. I.—*Improvement in Elastic Pessaries*.—Patent dated January 24, 1860.—The cup A is made of some very soft and elastic substance, and is formed like an inverted bell. At its margin it is about one sixteenth part of an inch thick, and is gradually increased in thickness from the margin toward the bottom of it, where it is about one tenth of an inch thick. In the centre of its bottom is an aperture.

The inventor says: I *claim* the peculiar form and peculiar size, combined with great softness and elasticity of the cup.

I also claim the method by which the cup is kept in position, substantially as above specified.

No. 26,942.—THEODORE T. WOODRUFF, of Philadelphia, Pa.—*Improvement in Seats and Couches for Railroad Cars*.—Patent dated January 24, 1860.—This invention is explained by the claim and engravings.

The inventor says: I *claim* the combination of the two sets of seat and back frames, arranged and combined with the car by supporting ways, substantially as described, so that when the said two sets of seat and back frames are opened out they shall constitute a couch suitable for two persons, as set forth.

And I also claim the combination of the two opposite frames, each connected with the car by means of hinged bars on which they slide, substantially as described, to form together an elevated couch, as set forth.

No. 26,943.—JOSEPH YORBROUGH, of Milton, N. C.—*Improvement in Dressing Millstones*.—Patent dated January 24, 1860.—The grooves *e e¹ g* in this invention are so arranged that they can be made of considerable depth, and that they allow the grain to spread over the whole surface of the stones, and at the same time they are brought in such relation to one another that no kernel is allowed to escape before it has been completely reduced.

Claim.—The arrangement of the main grooves A, with radial branches *c* and tangential branches *d*, in combination with the large grooves *f* and *h*, and with the small grooves *e*, *e¹*, and *g*, to operate substantially in the manner and for the purpose specified.

No. 26,944.—ISAAC EDELMAN, of Philadelphia, Pa., assignor to G. W. EDELMAN, of said Philadelphia.—*Improved Water Closet*.—Patent dated January 24, 1860.—This invention consists in the arrangement of the notched pipe and plate arranged within the basin for discharging the water into the latter in a thin stream, which has a thoroughly cleansing effect.

The inventor says: I *claim* the arrangement of the three-way cock I, having its plug central with the hinge of the lid J, the vessel N, and pipes K, L, and M.

Second. The tube P, with its notched end, in combination with the plate Q, arranged within the basin, as set forth, for the purpose specified.

No. 26,945.—GEORGE K. FARRINGTON, of Xenia, Ohio, assignor to himself and GEORGE H. READ, of said Xenia.—*Improvement in Coffee Pots*.—Patent dated January 24, 1860.—The nature of this invention will be understood by the claim and engravings.

Claim.—The arrangement of the apertures *d d* in the sides of the condenser B, at a uniform height and in such relation to the bottom of the inverted cup D, as to keep the condensing water at a constant height, and low enough to allow the steam to escape at a pressure ordinarily obtained in the coffee pot, in combination with the vent apertures *m p*, or their equivalents, substantially as and for the purpose specified.

No. 26,946.—HENRY W. HENLEY, of New York, N. Y., assignor to ALBERT PALMER, of Jersey City, N. J.—*Improved Ventilating Bedstead*.—Patent dated January 24, 1860.—This invention consists in attaching to an ordinary bedstead one or more fans D D, which, being used in conjunction with a mattress formed of a series of serrated sections B, driven or propelled by means of clock work C, shall operate in such a manner that a current of air shall constantly be driven up through the serrated mattress.

Claim.—Combining one or more fan or fans with the mattress formed of the serrated sections or its equivalent device, when the same shall be arranged and operated in the manner described and for the purpose specified.

No. 26,947.—ANDREW HUNTER, of Hereford, Va., assignor to himself and PETER HUNTER, of Adams County, Ohio.—*Improved Rat Trap*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the bell crank G in connection with the drop gate D and platform F, substantially as and for the purpose set forth.

Second. I claim the combination of the mechanism by means of which the animal is made to reset the trap, consisting essentially of the tilting platform K, escapement M, escapement wheel and axle N, cord Q, and weight P, substantially as described.

No. 26,948.—A. F. JOHNSON, of Boston, Mass., assignor to ALFRED B. ELY, of Newton, Mass.—*Improvement in Sewing Machines*.—Patent dated January 24, 1860.—The nature of this invention will be understood by the claim and engravings.

The inventor says: I *claim* the rotary hook *v*, constructed as described or in any manner equivalent thereto, in combination with a needle and bobbin, for the purpose of forming a seam by the interlacing of two threads, as set forth.

Second. I claim the shoulder *t*, or its equivalent, for the purpose of preventing the point *i* from being entangled with the old loop, as set forth.

Third. I claim passing that portion of the loop that lies in the groove *n*, or around the periphery of the hook during the first portion of its revolution, behind the bobbin, as set forth.

No. 26,949.—WILLIAM LEWIS, of Brooklyn, N. Y., assignor to M. J. DRUMMOND, of New York City.—*Improved Method of Attaching Scabbards to Belts*.—Patent dated January 24, 1860. This invention consists of a plate or escutcheon *a*, attached to the waist belt or sash, and provided with an opening that passes a button *c* on the sword case, and then retains the shank thereof by a spring latch *e*, in such a manner that the sword will hang freely, but is firmly fastened to the sash.

Claim.—The escutcheon *a*, receiving the button *c*, on the sword case, when combined with the spring latch, or its equivalent, passing over the shank of the button, as and for the purposes specified.

No. 26,950.—ALLEN LAPHAM, of Brooklyn, N. Y., assignor to himself and C. A. DURGIN, of New York City.—*Improved Steam Trap*.—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, arranging and combining with a float, operating as described, the channels for the introduction of steam, whereby I am enabled to equalize the pressure upon the float, substantially as set forth and specified.

Second. I claim combining with a vertical rod a float which moves upon said rod and operates the valves by mechanism, substantially as set forth and specified.

Third. I claim combining with a float, operating as described, a double or compound valve, substantially as set forth and for the purposes specified.

Fourth. I claim combining with a float, having a movement independent of the valve rod,

the mechanism described, or its equivalent, for operating the valves, substantially as set forth and specified.

No. 26,951.—JOHN E. NEILL, of the United States Navy, assignor to C. S. POMEROY, of New York City.—*Improved Wrench*.—Patent dated January 24, 1860.—B is the movable jaw with its slot enlarged to admit of motion towards the stationary jaw and bar, but permitting no lateral movement; C is a collar sliding upon the bar bearing upon the upper surface of the nut D, and confined in contact therewith by a tongue or lug F entering a groove cut in the circumference of the nut.

Claim.—The use of the jaw B in connection with the collar C and nut D, when said jaw is constructed and operated in the manner specified.

No. 26,952.—GEORGE NEILSON, of Boston, Mass., assignor to HOLMES, BOOTH & HAYDEN, of Waterbury, Conn.—*Improvement in Lamps*.—Patent dated January 24, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* an improved lamp cone or deflector D, as made with its lip or flanch *a*, corrugated or formed with ridges to support the chimney and not only form air passages underneath its lower edge, but to direct and insulate the several currents under the chimney, as stated.

And in a cone or deflector so made, I claim constructing each chimney supporting corrugation concave on its under side and with a closed outer end, as specified.

No. 26,953.—GEORGE K. PROCTOR, of Beverly, Mass., assignor to himself and G. H. STICKNEY, of said Beverly.—*Improved Lamp Lighting Device*.—Patent dated January 24, 1860. This invention consists in applying to a lamp a match holder and friction plate, the latter having a spring connected to it and so arranged that when liberated and actuated by the spring the friction plate will ignite the match and thereby cause the lamp to be lighted.

The inventor says: I *claim* the partially rotating and yielding plate E operated by the spring D, or its equivalent, and attached to the shaft C in connection with the hook *j* also attached to shaft C, the catch *n* on lever G, and the match holder *c*, the latter being arranged relatively with the wick tube *d* of the lamp, substantially as and for the purpose set forth.

I also claim the extinguisher H attached to the rod I, in connection with the crank *k* on the rod F, arranged, substantially as shown, to insure the exposure of the wick simultaneously with the ignition of the match *g*.

No. 26,954.—JAMES W. PECK, JR., of Brooklyn, N. Y., assignor to himself and L. B. HAUXHURST, of said Brooklyn.—*Improved Helical Spring*.—Patent dated January 24, 1860. This invention consists in crimping or corrugating the steel wire previous to forming it into a coiled or helical spring, and in conjunction with this crimping it consists in giving to the wire at each bend a half twist, which will give resilient action to the wire when formed into a coil.

Claim.—The corrugated or zigzag wire spring herein described as a new article of manufacture.

No. 26,955.—JOSEPH SMITH, of Cincinnati, Ohio, assignor to himself and ROBERT R. LYND, of said Cincinnati.—*Improvement in Shears*.—Patent dated January 24, 1860.—The action is first to close quickly the heel or inner end of the blade D down upon the work, after which the blade D acts upon the blade A with a nearly uniform draw cut from the heel to the front.

The inventor says: I *claim* the oblique guide slots *e*, guide pin E, and wrist F, constructed, combined, and operating in connection with the blade D and handle *d*, substantially as and for the purposes set forth.

Second. The construction and combination of the dovetailed back *a*, stub J, and movable bit H, of the blade adapted in the manner set forth, to preserve the original length and breadth of the blade and the position of its cutting edge.

No. 26,956.—JOSEPH STEGER, of Mattewan, N. Y., assignor to JAMES M. FREAR, of Peekskill, N. Y.—*Improved Device for Attaching Spirit Levels to Squares*.—Patent dated January 24, 1860.—The inventor says: This invention consists in providing the lower part of the level with a groove and spring A and the insertion of mercury, spirits, or water, in such a manner that I am enabled to level from above by reversing the level.

Claim.—A level constructed as set forth, so as to be adjusted to an ordinary square in the manner shown.

No. 26,957.—JOSHUA TURNER, of Cambridgeport, Mass., assignor to himself, J. T. BARTLETT, and E. E. BUTMAN, of Boston, Mass.—*Improved Glue Pot*.—Patent dated January 24, 1860.—The steam from the water vessel is made to pass into the cover or cap D, and operates

not only to heat the contents of the vessel A, but to supply the same with condensed water sufficient to compensate for the water lost by evaporation in such vessel while the cover may be off the two vessels A and B.

The inventor says: I *claim* the improved article of manufacture, or glue pot, constructed not only with one or more steam escape passages *a* leading out of the space between the glue holder A and the water vessel C, but with a steam retainer and condenser D applied to cover both vessels A and B, and operate therewith, substantially as specified.

And in conjunction therewith, or with a glue pot made with the vessels A B and cover or condenser D, arranged and connected by one or more passages *a*, as described, I claim the sponge receiver or water and sponge heater E arranged therewith, substantially as specified.

No. 26,958.—SYLVENUS WALKER, of Boston, Mass., assignor to WILLIAM P. SPENCE, of said Boston.—*Improved Egg Beater*.—Patent dated January 24, 1860.—The beaters are plunged vertically into a suitable vessel containing the necessary quantity of eggs, the handle C is grasped and held firmly in the left hand, while the handle C¹ is held rather loosely in the right hand and vibrated back and forth, by which movement the beaters are rotated, but in opposite directions.

Claim.—The arrangement and combination of the oblique rack and pinions operating in the manner and for the purpose substantially as set forth.

No. 26,959.—ZACHARIAH WALSH, of Newark, N. J., assignor to C. WALSH, of said Newark.—*Improvement in Locks for Carpet Bags*.—Patent dated January 24, 1860.—This invention consists in combining one or two catches or bolts D E with a slide C, whereby the bag may not only be locked at or near each side consecutively, but also enabling both catches or locks to be unlocked simultaneously with a single operation of the key.

Claim.—The combination of the slide C with one or more spring catches D E placed within a suitable case A, and arranged to operate with the shackles *ff*, substantially as and for the purpose set forth.

No. 26,960.—NORMAN WIARD, of Janesville, Wis., assignor to DANIEL J. TOWNSEND, of New York City, as his trustee.—*Improvement in Locomotive Vehicles for Running on Ice or in Water*.—Patent dated January 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the following elements, viz: a watertight boat B capable of floating on runners or skates C C D D to run on ice and sustain the boat thereon, and so connected with the boat as to turn for steering, substantially as described, and a single traction or propelling wheel placed centrally between the runners or skates to act on the ice, for the purpose of propelling the boat when its runners or skates rest on the ice, substantially as described. I am aware that the traction wheels fast on one and the same driving axle have been combined with runners and a boat; but in such case the runners were not swivelled to the boat to change the direction of the line of travel, and the two wheels being fast on the same axle would resist any means employed for steering; and hence I do not wish to be understood as claiming, broadly, the combination of traction wheels with runners or skates and a boat, but to limit my claim to the combination above stated.

Second. I also claim combining the traction or propulsion wheel E and the boat by interposed springs, or equivalents thereof, that the wheel may be self-adapting to any inequality of surface, while the runners rest on the surface of the ice, as set forth.

Third. I also claim, in combination with the boat and runners, or skates, the mechanism substantially as described, for lifting the runners from the ice, by lifters F which sustain the weight, substantially as described, whereby the runners can be prevented from becoming fastened by frost to the surface of the ice, when at rest, as set forth.

Fourth. I also claim the stationary runners attached to the bottom of the boat, in combination with the movable runners or skates at the sides, substantially as and for the purpose set forth.

Fifth. I also claim constructing the traction wheel, substantially as described, that is, with its periphery a sharp cutting edge, to penetrate into the ice, to prevent the boat from moving sideways, and thereby admit of using runners smooth or rounded, when such periphery is combined with lateral projecting wings having cutting edges to penetrate into the ice and take hold therein from traction, substantially as described.

Sixth. So connecting each of the movable runners or skates with the boat that each may turn in a horizontal plane on an axis I, substantially as and for the purpose described.

Seventh. I also claim combining with the turning runners or skates and with the steering chains L M the tension or adjusting blocks, or equivalents, substantially as and for the purpose specified.

Eighth. And I also claim connecting the ice-penetrating brake by a hinged rod or arm Q to the boat, substantially as described, in combination with the connection of it by the toggle-joint lever *r*, or the equivalent thereof, with a steam piston, substantially as and for the purpose specified.

No. 26,961.—HENRY S. SCHELL, of Philadelphia, Pa.—*Improvement in Creepers to Prevent Slipping on Ice*.—Patent dated January 24, 1860.—This invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the pin D, or any other contrivance essentially the same, by which the side pieces B and C are prevented from revolving backwards.

Second. The adaptation of the pole and pin E, or screw H, to the plate A, or any arrangement substantially the same, by which the creeper is secured.

Third. The mode of attaching the creeper to the heel, viz: by pushing the points of the plates B and C as far forward as possible, and then forcing the bent end of it over the front of the heel, substantially as before stated.

No. 26,962.—HENRY B. ADAMS, of New York, N. Y.—*Improvement in Fan Blowers*.—Patent dated January 31, 1860.—The gradual recession of the interior surfaces of the casing *e* from the centres of rotation, enables the fan wheels *b* to crowd in and impart a large volume of air.

Claim.—The casing *e* of the described configuration, when in combination with double working plane surface blades *c c*, as described.

No. 26,963.—JOHN A. BASSETT, of Salem, Mass.—*Improvement in Apparatus for Decomposing Steam*.—Patent dated January 31, 1860.—This invention consists of a special form of apparatus for decomposing steam, so as to obtain hydrogen abundantly from it.

Claim.—The employment of a retort furnished with a hollow pipe in the axis of the retort, perforated in the manner set forth, the whole operating in the way and for the purpose described.

No. 26,964.—W. W. BATCHELDER, of New York, N. Y.—*Improved Method of Lighting Gas by Frictional Electricity*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* attaching the electrometer to the gas fixture, substantially as and for the purposes set forth, meaning by gas fixture that part of the gas pipe or conductor which is in proximity to the burner, and to which the burner is attached, whether it be a bracket, drop light, chandelier, or stand, or other analogous fixture.

I also claim connecting the electrometer with the stop cock, so that the act of turning the same to "let on" the gas, shall bring the electrometer into action, as set forth.

No. 26,965.—C. F. BAXTER, of Boston, Mass.—*Improvement in Filters*.—Patent dated January 31, 1860.—The engraving presents a vertical section. A is the concave globe of the exterior case, and B the interior sectional diaphragm fitted thereto; *b* is the lever by which the diaphragm is actuated from side to side. The water enters at C, passing through the filtering medium D and out at E; *c* indicates where the globes are united.

Claim.—Operating the movable diaphragm within the globe, substantially as described and for the purpose set forth.

No. 26,966.—W. D. BUNTING, of Cleveland, Ohio.—*Improved Composition for Tanning Skins and Hides*.—Patent dated January 31, 1860.—The following are the proportions used in this composition: Seven gallons of boiling soft water, fifteen pounds of terra japonica, four ounces of dry elder leaves and bark, and six ounces of powdered nutgalls, stirred thoroughly until completely macerated. To this eight gallons of cold water are added. One pound of potato starch is then put in, with an equal quantity of common salt; the whole is stirred together, when it is ready to receive the skins. Four ounces of alum and fourteen ounces of whiting are then added.

Claim.—The composition of terra japonica, nut galls, elder, alum, salt, whiting, and starch, in the proportions stated, in the manner and for the purposes set forth.

No. 26,967.—GEORGE COLHOUN, of Philadelphia, Pa.—*Improvement in Ventilators*.—Patent dated January 31, 1860.—By this invention the air, as the car moves along, is compressed around the outside of the elevated elbow pipe and also within the inner cone, and then suddenly escapes through and outside of the mouth of the elbow pipe in such a manner as to produce a vacuum in the elbow pipe, and a consequent rushing out of the vitiated air which the car contains.

Claim.—The inner and outer receiving cones C D, elbow pipe B, and flaring discharge pipe F, when the whole is constructed, arranged, and combined, substantially as and for the purpose set forth.

No. 26,968.—VOSCO M. CHAFEE, of Xenia, Ohio, assignor to Himself and C. DE WITT SMITH, of Washington, D. C.—*Improved Clamp for Making Clevises*.—Patent dated January

31, 1860.—The nature of this invention will be understood by examining the claim and engraving.

The inventor says: I *claim*, first, the clevis clamp or tongs, composed of the jaws A and A¹, constructed as described, and operating in the manner specified.

Second. I also claim the combination of the jaws A and A¹, with the handles B and B¹, or their equivalents, for operating the jaws, in the manner described.

No. 26,969.—JACOB B. CURRIER and ANDREW J. SIMPSON, of Lowell, Mass.—*Improved Arrangement of Air and Mercurial Thermometers*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of the sealed thermometer and the barometric thermometer, when both have the same range from temperature for determining the pressure of the atmosphere, substantially as described.

Second. We claim the method of adjusting the two thermometers so that a change in the weight of the atmosphere will be indicated by their variation.

No. 26,970.—LESTER DAY, of Buffalo, N. Y.—*Improved Churn*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the breakers E, having shoulders or offsets H and H¹, and permanently connected to the crosspiece F, so as to be removable therewith, and extending from the crosspiece to the bottom of the churn, for the purposes and substantially as described.

Second. The adjustable dash blades D, placed diagonally on the arms C, and arranged to operate with the breakers F, for the purposes and substantially as set forth.

No. 26,971.—B. F. DELANO, of Boston, Mass.—*Improved Attachment of Rudders*.—Patent dated January 31, 1860.—This invention has for its object to prevent the vibration and shaking of the rudder which wears upon the pintles and their bearings, and consists of a device for tightening up the rudder and preventing this play or jarring while it is left free to swing on its pintles as usual.

Claim.—The described device *g h k*, or its substantial equivalent, for tightening up the rudder, operating substantially as described.

No. 26,972.—THOMAS H. DODGE, of Washington, D. C.—*Improvement in Combined Reaping and Mowing Machines*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the inclined projecting end of the beam D, with the rear end of the main frame A, and draft connection *b*, substantially as set forth.

Second. I claim the combination of the shoe or brace H, with the sheath or tube H¹, and hinged forks or arms I I, substantially as set forth.

Third. I claim extending the journals of one of the forks I, of the sheath or tube H¹, through its hinge, to form the journal of the pulleys 6 and 7, the parts being arranged substantially as set forth.

Fourth. I claim the combination of lever *m*, with its dog *m*¹, with case H¹, and shoe H, substantially as set forth.

Fifth. I claim making the upper part of the raker box, in the form of a hollow frustrum of a cone, and the bottom concave, substantially as shown in Figs. 7, 8, and 9.

Sixth. I claim covering the surface of the reel ribs with India rubber, or its equivalent, substantially as and for the purposes set forth.

No. 26,973.—GEORGE DOYLE, of Ottawa, Ill.—*Improvement in Electric Telegraphs*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—I claim collecting a current induced by a current passing through a primary conductor in a metal sheathing surrounding but insulated from the primary conductor, and employing such induced current either in connection with the primary current, or alone, to work telegraph instruments, substantially as described.

I also claim combining the action of the primary and induced currents, by means of two electro-magnets, one in each circuit, so applied in combination with a lever carrying both their armatures, that both magnets act in concert to move the said lever, substantially as specified.

I also claim combining the use of hardened steel cores in the electro-magnet of the induced current, with the use of soft iron cores in the electro-magnet of the primary current, substantially as and for the purpose specified.

No. 26,974.—EUGENE DUCHAMP, of St. Martinsville, La.—*Improvement in Furnaces for Evaporating Sugar Juices*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described arrangement of horizontal steam boilers E, in rear of the furnace K, flue spaces formed by walls B B, whereby the flame and smoke is directed from the fur-

nace K, between the walls or partitions A A and B, to the rear of the furnace, and thence under the steam boilers through the furnace D, when it finally escapes through the chimney M, as indicated by the direction of the arrows. This I claim, in combination with the pipes G H and L, arranged under and serving as supports for the evaporating pans, all in the manner and for the purposes described and represented.

No. 26,975.—DANIEL N. DUNZACK, of Salem, Mass.—*Improved Method of Operating Stop Cocks*.—Patent dated January 31, 1860.—When the water is to be let into the small pipe from the main pipe X, the lever B being canted to the right side, and the slide O being at its lower end, one end of the wire is passed through a pulley secured directly over the faucet in the small pipe and fastened to the outer end of the toggle y, which is in the head of A. When the wire is pulled the upper end of the toggle y will be canted towards the wire, when its base, which rests on the bottom of the hollow head A, will lift one end of the slide O.

Claim.—The arrangement and combination of the several parts when arranged and combined as described for the purpose set forth.

No. 26,976.—JOSEPH L. DUTTON, of Cherry Lake, Florida.—*Improvement in Ploughs*.—Patent dated January 31, 1860.—This invention consists in the arrangement of devices forming a plough, which can be altered to cut deep or shallow furrows, and the handles of which can be easily adjusted.

Claim.—The arrangement of the beam A, notched adjusting bar I, handles D, crossbars C, hooked staple H, and wedge F, with the notched heel C, and notched and slotted toe B, the whole of the parts being constructed for joint adjustment as set forth.

No. 26,977.—JACOB EDSON, of Boston, Mass.—*Improvement in Machines for Cutting and Splitting Leather*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the bent knife, so constructed as to cut the leather both to a width and thickness, either in a horizontal or a bevelled line, at the same time, and whereby a cutter of greater strength and stiffness is obtained, as set forth.

Second. I claim the use of the tongue i, operating upon the leather as described and for the purpose specified.

Third. I claim attaching the cutter or cutters to a stock made adjustable, so as to vary, according to the position in which the said stock is set, the width of the strip cut and its bevel or angle, by means substantially as described.

No. 26,978.—MATTHEW EDWARDS, of Cambridge, Mass.—*Process for Coloring the Surface of Metals*.—Patent dated January 31, 1860.—This invention consists in a process of coloring, bronzing, or darkening metals, which is peculiarly applicable, in connection with the well known process of electro-plating, to the production of a black, brown, or other colored ground work to white lines, or marks of silver or other white metal.

Claim.—The new process, substantially as described, for coloring, darkening, or bronzing metals, when the same is applied to metals that have had a previous deposit of white metal upon them.

* No. 26,979.—ANDREW FERBER, of Elizabeth, N. J.—*Improvement in Shutter Fasteners*.—Patent dated January 31, 1860.—The object of this invention is to obtain for window shutters and blinds a fastening by which the shutters may be secured in an open or closed state, and also secured at any intermediate points without depending upon any fixtures connected with the outer side of the building beyond the window sill.

Claim.—The plate D, attached to the shutter or blind C, provided with the hook b, and the socket c, the curved rod E, provided with the eye f, and the sphere or ball e, which is fitted in the socket c, and the pins in the sill B; the whole being arranged substantially and for the purpose set forth.

No. 26,980.—CHANDLER FISHER, of Milton, Mass.—*Improved Curtain Fixture*.—Patent dated January 31, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Hanging the spool end of the curtain rod upon the curved spring g, attached directly to the bracket C, as set forth, for the purpose specified.

No. 26,981.—JOHN M. FORREST, of Norfolk, Va.—*Improvement in Carriage Springs*.—Patent dated January 31, 1860.—This invention consists in a mode of forming and connecting the springs of vehicles so as to make them accommodate themselves to the varying weights imposed, retaining their elasticity through a greater range of strain than the springs in common use.

Claim.—A carriage spring, constructed, arranged, and operating substantially in the manner described.

No. 26,982.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in Manufacturing Rubber Belting.*—Patent dated January 31, 1860.—The claim explains the nature of this invention.

Claim.—The method described of manufacturing belts or bands of India rubber or gutta percha, the same consisting in placing them in contact with smooth plates of metal and then heating them, substantially in the manner and for the purposes specified.

No. 26,983.—A. GEIGER, of Dayton, Ohio.—*Improvement in Burners for Vapor Lamps.*—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the cone piece I I, which contains the non-conducting cork, with a break in the metal at the upper end of the cone piece between I I and B² B², this space being occupied by a ring of cork instead of the metal, so that the heat of the burner and cap may not be conducted down the tube I I, substantially as set forth.

No. 26,984.—EDGAR HAIGHT, of Buffalo, N. Y.—*Improved Paddle Wheel.*—Patent dated January 31, 1860.—In this invention the buckets pass through the air edgewise and strike the water with the fast edge ahead in whatever direction the wheel revolves.

The inventor says: I *claim*, first, the arrangement of the rings F F¹, rods *d*, and trunnions E E¹, or their equivalents, in combination with the buckets D, pins *r*, and guides *e*, or their equivalents, constructed and operating substantially as and for the purpose described.

Second. Giving to the buckets a complete revolution around the pins *b*, from which they are suspended, substantially as specified, so that they strike the water with the fast edge in advance, in whatever direction the wheel revolves.

Third. The employment of the links *c*, substantially as described, for the purpose of connecting the rings F F¹, with the rims A A¹ of the wheel.

No. 26,985.—LEWIS HARPER, of Riceville, N. J.—*Improvement in Fertilizers.*—Patent dated January 31, 1860.—The object of this invention is to provide a fertilizer, the basis of which is green sand, marl of the cretaceous formation, and other chloritic marls of the tertiary formations found in the middle and southern States.

Claim.—The method or process of making a fertilizer, by the employment of the described substances in the manner set forth, consisting of the series of steps specified, and resulting in a single compound or material, substantially as and for the purposes described.

No. 26,986.—FOREST H. HARWOOD, of Rushville, N. Y.—*Improved Mortising Machine.*—Patent dated January 31, 1860.—This improvement relates more particularly to that class of mortising machines which are designed to be worked by the hand or foot of the operator, and some of which are convertible so as to be used as boring machines.

The inventor says: I *claim*, first, the lever A, when hung and constructed to act substantially as described, in combination with the mandrel box H, provided with rollers, jaws, or clips *c c*, at its one side, for the hooked arm *b* of the lever to gear with, essentially as set forth.

Second. The combination, with the sliding mandrel box H, and mandrel raising spring L, of the adjustable upper mandrel roller M, for operating in connection with the lever A, substantially as and for the purposes set forth.

No. 26,987.—WAIT N. HAWLEY, of Hartford, Conn.—*Improvement in Machines for Pegging Boots and Shoes.*—Patent dated January 31, 1860.—By this invention the boot or shoe is secured in or upon a rotating stock, it (the stock) also being secured upon a three-way carriage, one movement being in and out of the machine; a second movement is made in a right line with the machine, and at right angle with the first; and a third movement by the lifting of the whole by means of weighted levers, so that the sole of the boot or shoe shall be firmly pressed upwards against the edge of a rough surface feed wheel, and the sole fed along to the action of the awl and the insertion of the peg, while its edge is held against a gauge and its movement guided by the hands of the operator.

The inventor says: I *claim*, first, an adjustable stock H, secured and operating upon a two-way carriage D E, and the frame C, having a perpendicular movement, arranged and operating as and for the purpose described.

Second. I claim the arrangement of the rough surface feed wheel R, in combination with the adjustable stock H, carriage D E, and frame C, operating as and for the purpose described.

Third. The arrangement of the roughened surface feed wheels R R¹, operating together as and for the purpose described.

No. 26,988.—WILLIAM H. HENDRICK and JOSEPH JACOBS, of Mount Vernon, Ohio.—*Improved Back Rest for Lathes*.—Patent dated January 31, 1860.—This invention consists in having two or more rollers placed in a curved arm or bar, and so arranged as to form a bearing for the work, the lower end of the arm or bar being secured by a bolt in a socket, and fitted loosely on the bolt, so that the device may be readily adjusted to and from the work as may be required, and secured in proper position to the work by a set screw.

Claim.—The curved arm or bar B, provided with two or more adjustable rollers C, and secured at its lower part in a box or socket A, substantially as and for the purpose set forth.

No. 26,989.—LUTHER E. HIGBY, of Shelburne Falls, Mass.—*Improved Pastry Board*.—Patent dated January 31, 1860.—The machine consists of a frame work A A, the side pieces being deeper than the cross piece. The pastry board is fitted in between the side pieces; on the upper side of each of the side pieces is secured a rack H, in which works a pinion I, secured on each end of the rolling pin B, that works to and fro over the pastry board by working the crank C. The pastry board F is made to rise and fall by an inclined plane, which is worked by drawing out the piece E.

Claim.—The combination and arrangement of the frame A, rolling pin B, crank C, pieces D, with an adjustable board F, rack H, and pinion I, substantially as and for the purpose specified.

No. 26,990.—JOEL HOOD, of Milwaukie, Wis.—*Improvement in Car Couplings*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the coupling pin by its arm to the coupling box, and in relation to the service pin, so that it may be operated as set forth.

Second. The arrangement of the stirrup, with its rollers and links and levers, in relation to the draught bar, so that the bar may be adjusted as described.

No. 26,991.—WILLIAM H. HOPE, of Washington, D. C.—*Improvement in Revolving Cutters, Ice Shavers, &c.*—Patent dated January 31, 1860.—This invention consists in the combination and arrangement of the parts of a machine for cutting ice, &c; also, in the peculiar formation and arrangement of the central knife, or bit, and top and hopper and removable partition, as well as in making a machine that will cut rapidly, from centre to circumference, the whole surface presented to the cutting disk.

Claim.—The peculiar shaped and arranged central bit or knife *c k*, in combination with the revolving disk D, presser P, and hopper H, or with apparatus substantially the same, for the purpose specified.

No. 26,992.—THOMAS P. HOWE, of New York, N. Y.—*Improved Inkstand*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the measuring cup, by which the supply of ink to the fountain or dripping cup is accurately graduated, with the piston, and the device for closing the tube at the end of the stroke, substantially as and for the purposes set forth.

No. 26,993.—SAMUEL HOYT, of Wilmington, Del.—*Improvement in Mill Spindles*.—Patent dated January 31, 1860.—This invention consists in combining the metallic eye of the running stone with the driving spindle, so that the stone is allowed a universal movement up and down while it is performing its revolutions.

Claim.—The combination of the sliding plug E, ball and socket bearing C *e* C¹, and slotted spindle B *b*, substantially as and for the purposes set forth.

No. 26,994.—NIKOLAUS HOTZ, of Trenton, N. J.—*Improvement in Nozzles for Hose Pipes*.—Patent dated January 31, 1860.—The inventor says: In this invention I arrange a perforated diaphragm, disk, or plate, of elastic material, within the discharge pipe, in such manner that it shall work in contact with an auxiliary diaphragm, disk, or plate, correspondingly perforated and attached to the nozzle of said pipe, which nozzle is so arranged as to revolve on the pipe to open and close its valve.

Claim.—As a new article of manufacture, a hoze nozzle constructed as set forth.

No. 25,995.—JOHN KEANE, of New York, N. Y., assignor to himself and F. H. BARTHOLOMEW.—*Improved Water Closet*.—Patent dated January 31, 1860.—The nature of this improvement is explained by the claim and engraving.

Claim.—The auxiliary lever *f*, operating the cock or valve that supplies water to the closet, when combined with the pan lever *d*, and pull *e*, substantially as described.

No. 26,996.—JAMES M. KERN, of Morgantown, Va.—*Improved Washing Machine*.—Patent dated January 31, 1860.—This invention relates to the peculiar construction of a washing machine, by which the heavier parts of the dirt which have been separated from the clothes, and which are kept suspended in the suds, are separated from the suds and retained in a chamber of the machine.

Claim.—In combination with the dasher E and inclined board c, the openings d, valve-covered opening g, and filtering diaphragm p, communicating with the chamber R, the whole being arranged and operating substantially in the manner and for the purpose described.

No. 26,997.—LEWIS KIRK, of Reading, Pa.—*Improvement in Brick Machines*.—Patent dated January 31, 1860.—The claim and engravings will give the reader an idea of the nature of this invention.

The inventor says: I *claim*, first, the double hoppers x and z, in combination with the flexible hose v, when constructed and arranged as and for the purpose set forth.

I also claim the flanged box i, and piston j, in combination with the reciprocating mould U, and cross head H, when constructed, arranged and operated as described and for the purpose set forth.

No. 26,998.—A LAFEVER and GEORGE C. BARNES, of Battle Creek, Mich.—*Improved Back Centre for Lathes*.—Patent dated January 31, 1860.—This invention consists in oiling the centre point, or that point against which the wood to be turned abuts, by causing the oil to flow from an oil cup through the end of the shank and to the point of a valve stem which, when not in use, will prevent the oil contained in the oil cup from flowing out; and it further consists in tapping the valve stem in the front end of the shank, and introducing a screw cap so that the self-oiler may be applied to old shanks by removing the old centre points.

Claim.—The valve stem b, spring c, and cup D, applied to the stock or shank A, essentially as set forth, arranged and operating so as to feed oil from a cup or other suitable receptacle to the object to be turned.

No. 26,999.—JOHN W. LATCHER, of Northville, N. Y.—*Improved Printing Press*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment or use of two platens H H, arranged with two beds E E and used in connection with a frisket U, so arranged as to pass down between one platen and bed to receive one impression, and then rise and pass down between the other platen and bed to receive the other impression, substantially as described.

Second. In combination with the platens, beds, and frisket, arranged as above, an inking device, composed of the cylinder S, distributing rollers i¹, dipping roller e¹, and fountain roller h¹, in connection with the rollers y attached to the frisket U, the whole being arranged for joint operation substantially as described.

Third. Securing the forms B¹ in or upon the beds E E by means of the movable jaws j², fitted in the upper and lower parts of the beds and connected to the right and left screw shafts u², substantially as described, to admit of the simultaneous movement of the upper and lower jaws for the purpose of securing the forms centrally to the beds.

Fourth. Giving the blanket X, of the second impression platen H, a movement by means of the ratchet s*, connecting rods v* v*, shafts w* a², and rod g*, put in motion by the movement of said platen and the stationary pawl t* at the under side of the fly board C, substantially as and for the purpose set forth.

Fifth. The arrangement, as shown, of the crank N, rod P, and radius bar Q, provided with the slotted segment j, in connection with pinions s s, racks t t, and shafts l p, for the purpose of operating intermittently the frisket U.

Sixth. The arrangement of the cam h², hollow cylinder e², and rod d², the latter being attached to the fly by the crank h², for the purpose of operating the fly, as set forth.

Seventh. The operating of the griper shafts r¹ r¹ by means of the double journal boxes g² attached to the hollow cylinder p², the pinions u¹ on the shafts r¹ r¹, the geared segment w¹ gearing into pinion n¹ of the hollow cylinder, the arms x¹ x² provided with springs y¹ y², and the dog z², crank a*, and the pin c** operated upon by the cam h* W, substantially as set forth.

Eighth. Having the gripers s¹ formed of two parts, so that one part d* may slide on the other part e*, for the purpose specified.

Ninth. The employment or use of the paper-feeding apparatus, composed of the disks or rollers o* placed on the shaft p* and the guards q*, directly over the disks or rollers, the above parts being secured at the inner edge of the feed board B, substantially as described.

No. 27,000.—RODOLPHUS LOUNSBURY, of Fulton, N. Y., and FRANCIS G. WILLSON, of Ontario, N. Y.—*Improvement in Horse Rakes*.—Patent dated January 31, 1860.—A is the head of the rake, B the teeth, C the handles, bolted firmly to the head and braced by a strong iron brace D under each, E the slide composed of an inch batten above and another below the teeth, with six blocks between; this slide moves freely from the head to the point of the teeth,

having a small chain F at each end, through which two of the bolts go, while the other end of the chains is held to the head by the leg of the staples G; these chains merely prevent the slide from flying off the teeth.

Claim.—The arrangement of the head A, chains F F, slide board k, teeth B, ropes I I, with knotted ends J and pulleys H H, the whole being constructed for joint operation in the manner and for the purpose described.

No. 27,001.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Machines for making Rubber Belting.*—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the improvement in the manufacture of machine belting or banding, composed of a woven fabric covered on one or both sides with India rubber or gutta percha, which consists in forming the edges thereof by means of an organized machine having its essential feature substantially as described.

Second. I claim the two revolving cutters arranged upon one and the same shaft to operate substantially in the manner and for the purposes specified, in combination with a suitable device for laterally adjusting the said cutters, so as to be adapted to the cutting off or removing of superfluous gum at the edges of belts of different widths.

Third. I claim the rollers h h, or their equivalent, acting as dies to form the belt and finish the edges thereof.

No. 27,002.—MALCOLM McDOWELL, of New York, N. Y., and NORMAN W. WHEELER, of Brooklyn, N. Y.—*Improvement in Combining Locomotive Engines and Cars.*—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a car body, substantially as described, in combination with a locomotive capable of action independent of the car, but, when combined therewith, forming the entire support of the forward end of the car, the combination of the two being such as to firmly support the car body, preventing undue oscillation and vibration, while a sufficiently flexible connection is maintained to properly turn curves, &c., all as specified.

No. 27,003.—IVES W. MCGAFFEY, of Buffalo, N. Y.—*Improvement in Straw Cutters.*—Patent dated January 31, 1860.—In operating this machine the material to be cut is placed in the feed box, formed of the side pieces A; the lever F is then grasped by the right hand of the operator and raised so as to bring the gate and cutter c to their highest position. The straw or hay is then moved along by the left hand until the ends but against the cross piece P, the material to be cut sliding up the incline of the flaps J so that it will pass over the edge of knives I.

Claim.—The arrangement of cutters I I, and C, spring flaps J J, triangular cutter n, and corner piece n¹, substantially as described, for the purposes specified.

No. 27,004.—JOHN MEESE, SR., of Milton, Ohio.—*Improvement in Bee Hives.*—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Providing the octagonal hive with central octagonal broad chambers A and A¹, arranged in relation to each other, and to the slides H and boxes B C, in the manner described, for the purpose specified.

No. 27,005.—A. G. MITCHELL, of Lansingburgh, N. Y.—*Improved Machine for Shaping Hair Brush Blocks.*—Patent dated January 31, 1860.—This invention consists in the use of a pattern in connection with guides, the pattern being so arranged that it may be turned on a centre, so as to admit of the shaping of the brush block without removing the same from the pattern; also in the use of an adjustable bed and clamp, so arranged as to admit of the facile manipulation of the pattern which is attached to and centred on said bed.

The inventor says: I *claim*, first, the pattern M, placed on a centre pin l, and so arranged that it may turn thereon and cause both sides of the brush block to be presented to the cutters without changing the position of the block on the pattern or removing it therefrom.

Second. The combination of the bed I and plate H, when connected together, as shown, to operate as and for the purpose set forth.

No. 27,006.—THOMAS MOFFET, of Chicago, Ill.—*Improved Railroad Time Indicator.*—Patent dated January 31, 1860.—This invention consists in placing around the dial of a clock a requisite number of rings between which the names of the different stations are arranged, whereby those having trains in charge may see at a glance the relative position of their time and the approaching station.

The inventor says: I *claim* the plate having the rings B B B, or their equivalents, attached thereto, as and for the purposes specified, in combination with the movable tablets.

I also claim the arrangement of the rings whereby each ring is suitable for two trains, as specified.

No. 27,007.—ISAAC E. PALMER, of Montville, Conn.—*Improved Bed Canopy*.—Patent dated January 31, 1860.—This invention is a portable canopy from which is to be hung a mosquito net.

The inventor says: I *claim*, first, the combination of the foot pieces A hinged together and locked in such a way as to form a clamp, as described, with pieces B B¹ C², when the same are constructed and arranged in the manner and for the purpose of forming a portable and adjustable stand for supporting canopy, Fig. 3.

Second. I claim canopy of Fig. 3, consisting of pieces F jointed together at their centre and connected to hoop or frame C by sliding metal ferrules, all combined as and for the purposes herein set forth.

No. 27,008.—HERMAN SALOSHINSKY, of Boston, Mass.—*Improved Machine for Attaching and Finishing Boot Heels*.—Patent dated January 31, 1860.—This invention consists of a machine for clamping the heel to the boot or shoe, and for punching the necessary holes and driving the nails which secure the heel.

The inventor says: I *claim* the above-described machine, consisting of the blocks G, I, and H, with their awls and drivers, and the mechanism for operating them, substantially as set forth.

Second. I claim, in combination with the above, the trimming knife P, operated in the manner substantially as described.

No. 27,009.—J. S. SANSON, of Philadelphia, Pa.—*Improvement in Railroad Switches*.—Patent dated January 31, 1860.—The object of this invention is to obtain a simple self-acting switch for city railroads, one that may be actuated by the passage of the horse and car over it, so as to be adjusted in line with either the branch or the main track, as may be desired.

Claim.—The tilting plates G G, provided with the flanches *ff*¹ and arranged in relation with the loaded levers H H¹ and the rails A A C C, to operate as and for the purpose set forth.

No. 27,010.—J. SCOVILLE, of Buffalo, N. Y.—*Improvement in Harvesters*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the hinged lever seat bar E, with the slotted journal boxes D and axis *c*, as and for the purpose shown and described.

Second. The employment of the slotted journal boxes D in combination with the traction wheel C and pinion *d*, as shown and described, whereby said traction wheel is left free to rise and fall independently of the frame A, for the purposes set forth.

No. 27,011.—JOHN SLOAN, of Pittsburgh, Pa.—*Improvement in Balanced Slide Valves*.—Patent dated January 31, 1860.—This invention consists in the use of a wedge shape slide valve, and in an arrangement for balancing the valve.

The inventor says: I *claim*, first, the use of the wedge shaped slide *x*, in combination with the steam chest, said steam chest being adapted in form and size to the form and size of the valve, as described and set forth.

Second. The use of the projection 1 and opening *u*, when used in connection with the guide and guard 2, as described, and for the purpose set forth.

Third. The use of the openings *r* in the valve *x*, when used in connection with the steam chambers *l* in the cap *m* and the steam ports *s* of the cylinder, as described, and for the purpose set forth.

No. 27,012.—C. M. SPENCER, of Manchester, Conn.—*Improvement in Machinery for Spooling Thread*.—Patent dated January 31, 1860.—This improvement of this machine consists in an arm connected to the thread guide, so as to be traversed and vibrated by it, and so as to operate certain other devices, to change the half nuts at the proper time to reverse the motion of the thread guide.

The inventor says: I *claim* the arm *a* in combination with the arms N N, shaft K, arm I, and inclined plane or pin *i*, for the purpose of operating the block L, so as to change the motion of the traverse rod, as described.

I also claim the arm J provided with a slide *m*, constructed so as to operate, substantially as described, in combination with the block L, for the purposes set forth.

No. 27,013.—GEORGE A. STONE, of Roxbury, Mass.—*Improvement in the Apparatus for Superheating Steam*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination, substantially in the manner and for the purposes specified, of these four things, viz:

First. A superheating chamber provided with flues, or their equivalents, for the passage of heated gases or flame, and with passages for the entrance and escape of steam.

Second. A steam jet pipe leading into a passage or pipe connecting with the flues and receiving steam from the chamber or boiler, and discharging it so as to make or increase a draft through the flues.

Third. A valve in the jet pipe.

Fourth. A rod, or its equivalent, exposed to the heat of the superheating chamber and acting upon the valve, substantially in the manner specified.

The whole combination being substantially such as is described, and acting to supply or furnish superheated steam at a nearly constant temperature.

No. 27,014.—FRANCOIS VOUELLON and FERDINAND TAVERNIER, of Paris, France.—*Improvement in the Manufacture of Yarn*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The manufacture of yarn by submitting slivers or rovings made by a carding machine, wool-comber, or otherwise, to a process of felting, as set forth.

No. 27,015.—LOREN J. WICKS, of New York, N. Y.—*Improvement in Skates*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The attachment of a hinged or jointed platform to the rigid runner of a skate, when the platform is so connected and attached to the rigid runner as to allow the platform to conform to the spring or movement of the foot of the wearer, as set forth.

No. 27,016.—WILLIAM W. WILCOX, of Middletown, Conn.—*Improved Sail Grommet*.—Patent dated January 31, 1860.—This invention consists of an eyelet separate from the two flanges between which the canvas is secured, so that the flanges can be made of cast-iron, or some other cheap metal, and that, when the grommet has to be taken off, both flanges can be saved and used again, nothing being required to refasten them but a new eyelet.

Claim.—The employment of a separate eyelet C in combination with the flanges A B, as and for the purposes shown and described.

No. 27,017.—JOHN P. WILSON, of Frankfort, N. Y.—*Improvement in Animal Traps*.—Patent dated January 31, 1860.—This invention consists in the method of constructing and arranging the several parts which form the trap.

The inventor says: I *claim*, first, the arrangement of the body A and hammer D with the cord H, pulley G, and barbed rod I, the same being connected and used substantially as and for the purpose specified.

Second. The employment of the stud F, which screws into the end of the body A, and which holds the pulley G, substantially as set forth.

Third. The employment of the screw K, the head of which is provided with the groove n, into which the enlargement I¹ on the rod I passes for the purpose of securing the trap to any object to which it may be attached, substantially as described.

No. 27,018.—ALVAH WORDEN, of Ypsilanti, Mich.—*Improved Holder for Tinman's Shears*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The circular revolving perforated metallic or other plate C¹, Fig. 2, so adjusted in the circular metallic or other ring A¹, Fig. 1, that the shears and stakes of the tinner may be placed in the holes D E F G, Figs. 2, 3, or 4, so that, by the rotary motion of the plate C¹, Fig. 2, which is held in place by the bolt, Fig. 3, the workman may, at pleasure, change the position of his shears and stakes without removing or lifting them from their places, and the use of such a combination as a holder or stand for tinner's shears and stakes.

No. 27,019.—McCLINTOCK YOUNG, JR., of Frederick, Md.—*Improved Heel Spur*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved equestrian heel spur, the said spur being formed essentially of the heel-shaped open frame a and its projecting hollow arm b, combined with the slit-headed screw shank d and its rotating spur head e, substantially as set forth.

No. 27,020.—GEORGE EDWARDS, of Worcester, Mass., assignor to himself and GEORGE M. RICE, of said Worcester.—*Improved Variable Exhaust Pipe for Steam Engines*.—Patent dated January 31, 1860.—This invention consists in making the flaps or movable portions of the nozzle of a circular section, or nearly so, and sufficiently elastic to cause them to spring out against the sides of the containing case with which they are combined, so that they shall be enabled to scrape off the matter which would otherwise accumulate and stop their motion.

Claim.—The described expanding nozzle, consisting of the elastic curved flaps B B², in combination with the containing case A, operating as set forth, for the purpose described.

No. 27,021.—JOSEPH H. JENKINS, of Smithville, Mo., assignor to himself and ELIJAH W. JENKINS, of said Smithville.—*Improved Saw Mill*.—Patent dated January 31, 1860.—This invention consists in an arrangement whereby the saw, although it is thrown off from the log and made to assume an inclined position as it ascends, is brought against the log and made to retain a perpendicular or nearly perpendicular position while it is descending.

Claim.—The employment of the armed rockshaft I, pitman H, eccentric G, and hinged swinging frame L, in combination with a reciprocating saw sash, in the manner and for the purpose described.

No. 27,022.—RICHARD LAMB, of New York, N. Y., assignor to himself and JOSEPH LAMB, of said New York.—*Improvement in the Manufacture of Artificial Marble*.—Patent dated January 31, 1860.—The claim explains the nature of this invention.

The inventor says: I claim, first, the described method of arranging the veining in artificial marble, that is to say, the separation of freshly mixed cement into balls of irregular sizes by agitating with dry cement, the application of one or more colors to the surfaces thereof, and compressing the balls together before they have commenced to set.

Second. Applying the coloring matter, in the form of a dry powder, to the surface of the balls, substantially as described.

Third. Mixing the coloring matter with pulverized cement, and distributing such mixture in a dry state among the balls, for the purposes set forth.

No. 27,023.—EUGENE M. MIX and JAMES E. MIX, of Ithaca, N. Y., assignors to W. I. HUNTINGTON and HARVEY PLATT, of said Ithaca.—*Improvement in Calendar Clocks*.—Patent dated January 31, 1860.—This invention consists in certain means of governing the movements necessary at the changes of the months, more especially the variable movement in the change from February to March.

Claim.—The employment of a year wheel K and detached leap year wheel L, applied and operating together, substantially as described, in combination with a detent J, or its equivalent, and a wheel F of the construction specified.

No. 27,024.—KINGSLEY R. OLMSTED, of Chicago, Ill., assignor to GILES F. FILLEY, of St. Louis, Mo.—*Improved Sawing Machine*.—Patent dated January 31, 1860.—This improvement consists in so constructing the inclined plane of the self setting apparatus that when the lever on the set rod presses backward with the gidding motion of the carriage, the lever end of said plane rises and allows the fixed arm with the roller at the end of the set lever to pass freely under it, after which the end of said plane drops to its proper position for operating the set lever so as to give the desired set to the log as the feed motion of the carriage again commences.

The inventor says: I claim the combination of the friction roller j, and slotted plate h, with the scale g, hand lever I, set lever H, set rod D, and sliding racks C C, arranged and operating substantially in the manner and for the purposes as specified.

I also claim the combination of the eccentrics o o, and offsetting plates S S, with the bed-plates T T, connecting rod U, and clutch lever O, constructed and operating for the purposes substantially as described.

No. 27,025.—BENEDICT TREUTLER, of Dale, Pa., assignor to Himself and SAMUEL W. WEISS, of said Dale.—*Improvement in the Process of Manufacturing Steel*.—Patent dated January 31, 1860.—This invention consists in the use of cyanide of potassium, sal ammoniac, and borax, which are mixed with the powdered charcoal used in manufacturing shear steel by the process of case hardening, and which, when used in varied proportions, impart to said steel varied degrees of hardness or softness.

Claim.—In connection with pulverized charcoal, the cyanide of potassium, sal ammoniac, and borax, as stated, the whole being used in the manner substantially as set forth.

No. 27,026.—SYLVENUS WALKER, of Boston, Mass., assignor to W. P. SPENCE and J. F. ADAMS, of said Boston.—*Improved Table Leaf Support*.—Patent dated January 31, 1860.—a is a spiral spring used to keep in place the lower end of the brace A, when locked by bearing against the thumb piece or short arm b of the brace; c is a metallic catch to sustain the brace while the leaf is held in a horizontal position.

Claim.—As my invention the joint formed by the brace A, combined with bracket B and spring a, as set forth and for the purpose specified.

No. 27,027.—HENRY B. BARBER, of Scott, New York.—*Improvement in Devices for Raising Water*.—Patent dated January 31, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The gears in combination with the clutch, two armed lever, and bevelled or cam shaped pins P P, substantially as described, for the purpose of automatically changing the

motion of the pulleys H H¹, when the buckets are emptied; the whole being constructed to operate substantially as described for the purposes set forth.

No. 27,028.—GEORGE S. ADLER, of Philadelphia, Pa.—*Improvement in Machines for Polishing Leather*.—Patent dated February 7, 1860.—This invention consists in the combination of a crank wheel I, a polisher j, and rods K L M and N, arranged in respect to each other and to the level table, whereby the proper movement is imparted to the polisher without the aid of the usual knee joints.

Claim.—The rod J, its projecting polisher j, and the crank wheel I, in combination with the rods K L M and N, the whole of the above parts being arranged in respect to each other and to the horizontal bed of the machine as and for the purpose set forth.

No. 27,029.—FRANK A. ALLEN, of Portsmouth, N. H.—*Improvement in Making Plaits in Sewing*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim my improved plaiting apparatus as made with the arrangement and application of the bars A B C, and the clamp guide H, as described.

I also claim the arrangement of the recess a, between the bar G, or the slider H, and the table D, when combined with the plaiting apparatus, constructed and operating substantially as specified; the same being so as not only to raise the bar off the table D, but enable the under surface of the bar to lap on the cloth transversely to the plaits formed thereon, the same serving to hold the cloth and plaits to great advantage.

No. 27,030.—JOHN ALLENDER, of New London, Conn.—*Improved Shoe and Bag Holder*.—Patent dated February 7, 1860.—This invention consists in so hanging or hinging one jaw to the other in such a position that when it is applied to a shoe, or other article, and pulled, the vibrating jaw is drawn down against the article held, so as to press against the opposite jaw in such a manner that the harder it is pulled the tighter it holds.

Claim.—The particular arrangement of the jaw C, with reference to the other jaw or stock A, by which the force used in pulling increases the pressure on the shoe or bag, substantially as set forth and described.

No. 27,031.—FRAZEE AYRES, of Rahway, N. J.—*Improved Washing Machine*.—Patent dated February 7, 1860.—This invention consists in the combination of a grooved roller with an endless apron, which is also grooved, and in arranging the roller and endless apron with respect to each other in such manner that while the apron moves slowly and continuously in one direction the roller, by means of suitable mechanism, is made to roll backward and forward under pressure over the apron, with the article to be washed between the roller and the apron partly or wholly immersed in the washing solution.

Claim.—The arrangement of the fluted roller C, raker or rincer x x, and endless apron O, with respect to each other and the other parts of the machine described, when operated in the manner and for the purpose specified.

No. 27,032.—DANA BICKFORD, of Westerly, R. I.—*Improvement in Window Sash Supporter*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the flat or sheet spring in combination with the bearings and friction roller, arranged so as to turn freely or stationary one way, as described in my specification.

No. 27,033.—D. F. BOYD, of Mansfield, Ohio.—*Improvement in Defecating Cane Juices*.—Patent dated February 7, 1860.—This invention consists in subjecting cane juice to a bath in a close vessel, in which vessel when steam is applied the steam generated from the juice creates a pressure upon the juice and communicates to it a high heat, and by the combined agency of high heat and pressure the impurities of the juice are precipitated as a preparatory process to evaporating.

Claim.—The operation described with the result, using the steam which arises from the cane juice for pressure.

No. 27,034.—JOHN BUTLER, of Buffalo, N. Y.—*Improvement in Reaping and Mowing Machines*.—Patent dated February 7, 1860.—D is an adjusting and supporting plate lying parallel to the plane of the driving wheel; the bolt e passing through the axle E of the driving wheel supports the plate and forms the axle upon which it turns to adjust the cutters. F is the gear frame in which is placed the gearing transmitting motion from the driving wheel to the cutters.

The inventor says: I claim, first, the adjusting and supporting plate D, in combination with the tubular arm F¹, and lever K, in the manner and for the purpose substantially as described.

Second. The gear frame F, which consists mainly of the tubular arms F^1 and F^2 , the hollow cylindrical part F^3 , collar O, and upward projection u^1 , constructed, arranged, and operating in the manner and for the purposes substantially as set forth.

Third. I claim the combination of the shoe M, gear frame F, and plate D, connected together in the manner and for the purpose substantially as described.

No. 27,035.—GEORGE W. CARTER, of San Francisco, Cal.—*Improvement in Amalgamators*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the amalgamation of gold with mercury by means of a machine which disperses finely divided dry auriferous ore at or near the bottom of a column of mercury, substantially in the manner as set forth.

I also claim the means, substantially as set forth, for preventing agitation of the mercury, consisting of the tube j , shield k , and wings l , whether the same are used separately or in combination.

No. 27,036.—IRA CARTER, of Champlain, N. Y.—*Improvement in Adjustable Carriage Springs*.—Patent dated February 7, 1860.—The object of this invention is to obtain a spring for vehicles capable of being graduated according to the weight to which it may be subjected.

Claim.—Transmitting the weight of the load of a wheel vehicle to its spring M, through the medium of an adjustable lever J, and the lever frames G G, or their equivalents, substantially as and for the purpose set forth.

No. 27,037.—JOHN H. CRANE, of Charlestown, Mass.—*Improved Spring Foundation for Beds, Sofas, &c.*—Patent dated February 7, 1860.—In this invention the bedding or upholstering rests directly upon such slats as are commonly used for similar purposes. The slats rest, toward each of their ends, upon pieces of curvilinear outline, which may or may not be springs in themselves.

Claim.—The combination and arrangement of parts described as forming an elastic foundation for the purpose set forth, the same consisting of the slats c , curvilinear pieces a , and links b , acting together substantially in the specified manner.

No. 27,038.—C. R. DAVIDSON, of Brooklyn, N. Y.—*Improvement in Railroad Brakes*.—Patent dated February 7, 1860.— h shows a cock attached to the locomotive; through this the steam may be made to issue from the boiler into the conducting pipe P. By this pipe the steam is conducted into the cylinder C, and there pressing against the head of the piston rod b , which is connected with connecting rod v , and guided by the slides K C, forces upward the lever A by its connection at the point i .

Claim.—The arrangement of the grooved shoe B, lever A, cylinder C, and spring M, constructed as described, for operating brakes on the rails, as set forth.

No. 27,039.—EDWARD P. DAY, of Boston, Mass.—*Improvement in Braiding Machines*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, when the spring and the ratchet and pawl are so arranged relatively to each other, that a stud or projection from and stationary relatively to the pulley cannot conveniently be made to actuate or trip the pawl, combining with the spring pulley a band or belt d , provided with a ring, or its equivalent, the same being not only to admit the movement of its tripping ring or device toward the pawl and away from the spring pulley, but to so connect the ring with the pulley that the retractive power thereof, or its spring, may be continually in action on the ring.

And I particularly claim the arrangement of the spring pulley, its lifter band and ring, so that the said band and ring may play within the spindle of the lifter while the pulley is arranged outside thereof, as set forth.

No. 27,040.—FRANK DOUGLAS, of Norwich, Conn.—*Improved Steam Trap*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the arrangement of the double valve B, its seats $s t$, passages $c c$, and connecting nozzle d , relative to the outlet of the trap, substantially as described.

Second. The connection of the puppet valve with the float by means of one or more pairs of crossed levers, one pair applied to the valve stem and acting against fixed fulcras, as described.

Third. The spring l , and adjusting screw m , applied in combination with each other and with the valve, substantially as and for the purpose specified.

No. 27,041.—R. H. DUNNING, of North San Juan, Cal.—*Improved Gold Separator*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The separator F F, having a secondary or false bottom composed of bars or strips G G, which bars are placed so as to have an opening c c between them, and over the opening or slats b b through the main bottom, the said separator being so arranged with reference to the receiver as to bring the said openings over the receiver, the whole arrangement being so inclined that a portion of the water and the auriferous particles will drop through into the receiver, while the larger gravel and rock will be discharged from the lower end of the separator, outside of the receiver, for the purposes substantially as described.

No. 27,042.—HENRY B. FAY, of New York, N. Y.—*Improved Paddle Wheel.*—Patent dated February 7, 1860.—The object of this invention is to obtain a paddle wheel which shall have a constant propelling action, and which will gradually increase as the floats or propelling wings are submerged, and be diminished as they are drawn up from the water, so that there will be very little if any lifting of water, and so that the greatest effective action of the floats will be in a direction parallel with the surface of the water.

Claim.—The form and construction of the described and represented paddle wheel.

No. 27,043.—ALFRED M. FOOTE, of New York, N. Y.—*Improved Lock for Umbrella Stands.* Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a stationary plate with the revolving lock plate, both of which are provided with notches for entering the umbrella, cane, or other article, when such plates are provided with suitable latches to retain the lock plate when turned, so as to inclose the article, as specified.

I also claim the combination of the latch e and check key f, fitted and acting in the manner and for the purposes set forth.

I also claim the notch 8 in the block 7, combined with the latch e, to afford additional security, as set forth.

No. 27,044.—JACOB FOX, of Philadelphia, Pa.—*Improved Drill Chuck.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A ball, divided into two or more parts, with a taper hole passing through its centre, in combination with a tapered drill shank or spindle, substantially as specified, for the purposes set forth.

No. 27,045.—WILLIAM A. GIBSON, of New York, N. Y.—*Improvement in the Disengagement of Self-acting Brakes.*—Patent dated February 7, 1860.—This invention relates to an improvement in that class of brakes for wheel vehicles in which the brake is actuated through the medium of the draught pole, without any direct or special manipulation on the part of the driver, and are consequently termed self-acting.

Claim.—The levers E E, with the shoes F F attached and connected to the slide bar D, in connection with the lever I, the above parts being applied to the vehicle, and arranged in relation with the draught pole H, substantially as and for the purpose set forth.

No. 27,046.—WILLIAM B. GILLET, of Auburn, N. Y.—*Improvement in the Method of Sharpening Files, &c.*—Patent dated February 7, 1860.—This invention consists in decomposing a solution of acid, or of a salt, by passing a current of electricity or galvanism through the said solution in such a manner that the oxygen or other corrosive element, upon being liberated, shall attack and dissolve the substance of a file immersed in the said solution.

Claim.—The application of the electro-chemical process described, for the purpose of recutting or sharpening steel rasps and files in the manner aforesaid, or any other substantially the same, and which will produce the intended effect.

No. 27,047.—R. D. GRANGER, of Albany, N. Y.—*Improvement in Cooking Stoves and Ranges.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making the ovens of cooking stoves and ranges with one or more of the plates thereof made of cast iron, with the inner surface thereof enamelled, substantially as and for the purpose set forth.

No. 27,048.—JOSEPH M. HEARD, of Aberdeen, Miss.—*Improvement in Moth Traps.*—Patent dated February 7, 1860.—This invention consists in the use of a lamp provided with a peculiar light bait reservoir, and cover, so arranged that moths and other insects are decoyed and destroyed.

Claim.—The arrangement of the circular projecting top D, lamp C, formed of the triangular plates c, phosphoric illuminator E, and reservoir or basin A, as and for the purpose shown and described; the whole being constructed as set forth.

No. 27,049.—R. HECKSCHER, of New York, N. Y.—*Improvement in Coal Carts*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the box F of a coal cart with two or more compartments *b c*, with their bottoms inclined longitudinally or at right angles to the axle C, each with a separate door *g* and *h* in the end, substantially as and for the purpose described.

Second. The arrangement of the trap door *f*, in combination with the compartments *b* and *c*, and with the doors *g* and *h*, constructed and operating substantially as and for the purpose specified.

Third. Forming the inclined bottoms of the compartments *b* and *c*, with the curved end *c*¹, as and for the purpose described.

No. 27,050.—HENRY WILLIAM HINDSLEY, of New Haven, Conn.—*Improvement in Piano-forte Keys*.—Patent dated February 7, 1860.—This improvement consists in making the upper part of the black keys for piano-fortes, &c., of a composition of gum lac and saw-dust, with a plate or slip of glass pressed into the upper surface to keep the surface smooth and also to serve as an ornament.

Claim.—The combination of the glass with the composition when the two are connected, without the use of any intervening adhesive substance, and the article is constructed and fitted for use substantially as described.

No. 27,051.—SILAS H. HODGES, of Rutland, Vt.—*Improvement in Railroad Switches*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A switch *c* and catch *e* used in connection with rails, all constructed and arranged as described, the switch being attached to the switch rod only by the catch, so that it will be held firm and insure an engine taking the side track for which it is adjusted, though it will be disengaged and thrown aside by an engine coming on the other track, and leave it a free passage, as shown above.

No. 27,052.—I. HODGSON, of Indianapolis, Ind.—*Improvement in Metallic Shutters*.—Patent dated February 7, 1860.—This invention consists in a peculiar way of connecting the slats of the shutter together and folding the same, so that a simple metallic shutter is obtained.

The inventor says: I *claim*, first, the guides D D attached to the inner sides of the jambs A, provided with expanded parts to form recesses D¹, to admit of the folding of the slats E, substantially as described.

Second. Connecting the slats E of the shutter together by means of the tubular pintle *b*, in connection with the eyes *a*, as set forth.

No. 27,053.—A. D. HOFFMAN, of Belleville, Mich.—*Improved Cross Cut Sawing Machine*.—Patent dated February 7, 1860.—This invention consists in the employment of a circular saw attached to a hinged or jointed bed, and arranged in such relation with a "buck," or wood holder, as to effect the desired end.

Claim.—The combination with the buck A, of the pivoted self-acting bed or saw carrier B, gears *e f*, lever F, and treadle G, as and for the purpose shown and described.

No. 27,054.—JAMES M. JAY, of Canton, Ohio, assignor to himself and JOHN DANNER, of said Canton.—*Improved Egg Beater*.—Patent dated February 7, 1860.—A is the stand upon the top of which is secured the lower half of the case A, which case is in the form of a hollow half globe. The cap or top C is also made in the form of a hollow half globe, so that when both the parts, B and C, are in the position shown in the engravings, they form a hollow globe. The lugs D are cast, or otherwise fastened to the upper part of one side of B, while on the other, and nearly opposite thereto, a lip F is similarly fastened.

The inventor says: I *claim*, first, making the case or shell of an egg beater in the form of a hollow globe or sphere, substantially as set forth.

Second. I claim the combination of a circular beater or beaters with the parts B and C, substantially as set forth.

Third. I claim the combination of the parts G E and D F with the parts B C, substantially as set forth.

No. 27,055.—ROBERT W. JENKS, of Providence, R. I.—*Improvement in Railroad Gates*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment or use of the sliding and stationary plates D E, slotted obliquely as shown, and having the journals *d* of the posts *a* fitted in the slots, substantially as and for the purpose set forth.

I also claim the means employed for operating automatically the sliding plates D, to wit: the rods F F¹, attached respectively to the bars G H, the rods at either side of the track being

connected by a lever I, when the said posts are used in connection with the swinging frames K, attached to the sides of the locomotive or tender and elevated by the levers L, and the projections *l* of the frames, and the projections *o o** on the side of the track, as set forth.

No. 27,056.—JAMES JONES, of Rochester, N. Y.—*Improved Hinge*.—Patent dated February 7, 1860.—The object of this invention is to provide a hinge that shall be self-acting when all its parts act conjointly, and at the same time answer equally well as a hinge of ordinary construction when one of those parts is removed.

The inventor says: I *claim* the use of the free movable ball *b*, in combination with an inclined groove or channel *d*, or of two reverse inclined grooves in the joint or bearing surfaces of the hinge, substantially in the manner and for the purposes set forth.

I also claim forming the recesses *c c*, at suitable points in the contiguous surfaces of the parts, in combination with the ball *b*, for the purpose of fastening the hinge when opened, substantially as herein described.

No. 27,057.—WILLIAM H. LAZELLE, of New York, N. Y.—*Improvement in Converting Rotary into Reciprocal Rectilinear Motion*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination, with a rotary shaft B and a slotted rod or slide C, of a compound crank D *c* E F *e* *f*, constructed and applied substantially as described, in connection with a stationary eccentric or way *d*, for the purpose of obtaining an irregular rectilinear movement of the said rod or slide by the rotary movement of the said shaft.

No. 27,058.—JOHN W. LOCKWOOD, of New York, N. Y.—*Improved Head Rest*.—Patent dated February 7, 1860.—This invention consists in providing a support for the head by means of a strap passing around the body and connected with strips of metal, or other material, resting upon the chest or shoulders, which at their upper extremities are connected with a similar strip passing behind the head, which last named strip is covered with a cushion or pad.

Claim.—A supporter for the head by the combination and arrangement of parts A B B C C, and strap D, substantially as above described.

No. 27,059.—CHELTON MATHENY, of Greensburgh, Ind.—*Improvement in Hand Spinning Wheels*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the vibrating arm which carries the spindle and its bearings so that said arm shall move in a horizontal plane and the spindle be sustained in the vertical position, substantially in the manner and for the purpose set forth.

No. 27,060.—THOMAS J. MAYALL, of Boston, Mass.—*Improvement in Machine Belting*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, machine belting made substantially in the manner and for the purposes described, with a friction surface formed partly or wholly of India rubber or gutta percha, while the cotton or other fabric which is thus covered is in a single sheet or ply and free from interposed rubber or other cement.

No. 27,061.—WILLIAM S. MEAD, of Buffalo, N. Y.—*Improvement in Apparatus for Generating Vapor in Lamps*.—Patent dated February 7, 1860.—This improvement is used in connection with an elevated reservoir for supplying etherial oil, or common burning fluid to the generating apparatus.

Claim.—The employment of the frustrum *a*, provided with a spiral thread and encased within the heater C, the same being arranged substantially as and for the purpose specified.

No. 27,062.—JOSEPH B. MAXWELL and JAMES A. MAXWELL, of Allegheny, Pa.—*Improvement in Bellows*.—Patent dated February 7, 1860.—This invention consists in making the nozzle and nozzle head of bellows in one piece, and in furnishing the nozzle head with a self acting valve, flanges, lugs, pivots, and attachment plate.

Claim.—The arrangement of the flanges *c*, attachment plate *g*, recess *x*, lugs or flanges *e*, pivots *f*, and self-acting valve *h*, as described and for the purpose set forth.

No. 27,063.—WILLIAM A. MORSE, of Boston, Mass.—*Improved Pen Handle*.—Patent dated February 7, 1860.—The inventor says: I make a pen stock of two pieces A and D; the part D I provide with a knife H; I connect these parts by means of a cylinder F, which serves as a sheath for the knife. The part D and knife H, when drawn out of the cylinder, may be used as an eraser, paper cutter, or pencil sharpener.

Claim.—The cylinder F, in combination with the parts A and D, and knife H, when the whole is constructed and connected substantially as described.

No. 27,064.—EMERY PARKER, of West Meriden, Conn.—*Improvement in Bolts for Door Locks.*—Patent dated February 7, 1860.—This improvement lies in the manner of constructing and inserting the smaller locking bolt, which is moved by a knob extending through the outer plate of the lock.

Claim.—The manner of constructing and inserting the smaller locking bolt specifically as described.

No. 27,065.—JOHN PARKER and EDMUND PARKER, of Meriden, Conn.—*Improved Coffee Mill.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the manner described of preventing the grinding surfaces from coming in contact, that is to say: by so constructing the grinding cone that its smaller end shall come to a bearing against the plate C, in the manner and for the purposes set forth.

We also claim the projecting piece g, in combination with the enlarged portion of the delivery aperture for the purpose set forth.

We also claim the manner of affixing the hopper, specifically as described.

No. 27,066.—NORMAN PLATT, of Jackson, Miss.—*Improved Life Preserver.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the bellows C, or their equivalent in effect, secured to the body and sleeves of the preserver, and having a tube communicating with the air space of said preserver, and being so arranged as to be operated by the motion of the arms of the wearer in such manner as to inflate the preserver with air, substantially as and for the purposes set forth.

No. 27,067.—JULIEN QUÉTIL, of New York, N. Y.—*Improvement in Apparatus for Moving Heavy Weights.*—Patent dated February 7, 1860.—The object of this invention is to transport heavy weights, such as large logs, blocks of marble or stone, heavy pieces of machinery, &c., from one place to another. The apparatus is so arranged that such weights can be transported up hill and over rugged ground.

The inventor says: I *claim*, first, the arrangement of the bridge A, in combination with the lifting jacks B and C, and with the frame F, or their equivalents, substantially as and for the purpose specified.

Second. The combination, with the frame F, or its equivalent, and with the bridge A, of the windlass E, substantially in the manner and for the purpose set forth.

No. 27,068.—ADOLPH H. RAU, of Philadelphia, Pa.—*Improved Station or Street Registering Indicator.*—Patent dated February 7, 1860.—This invention consists of a rim or dial, carrying the numbers or names of the streets or stations, provided with certain devices for turning and holding said rim or dial.

The inventor says: In combination with the rim or dial carrying the numbers or names of the streets or stations, I *claim* the devices, substantially described, for turning and holding said rim or dial.

No. 27,069.—SAMUEL RAY and M. R. SHALTERS, of Alliance, Ohio.—*Improved Combined Chair and Crib.*—Patent dated February 7, 1860.—The object of this invention is to combine a rocking chair and crib in such a manner that the device may be used for either purpose.

Claim.—The permanent bottom A, supplemental bottom B, permanent arms D, and supplemental arms E, with traverse frame F attached, and the turning and the sliding leg and rocker frame g, formed of the bars *a a d* and *f f g*; the whole being combined and arranged as and for the purpose set forth.

No. 27,070.—AUGUST REICHARD, of Washington, Mo.—*Improvement in Pumps.*—Patent dated February 7, 1860.—F is a frame to which the pump cylinder C and air chamber A are permanently attached; P is a hollow piston and piston rod, furnished with a valve V. The motion is communicated through the lever M and connecting link N to the hollow piston P.

Claim.—Combination of the valve B and lever L, valve V, and its rod and rest T, with the hollow plunge or piston P, arranged and operating substantially as described.

No. 27,071.—HENRY A. RIDLEY, of Somerville, Tenn.—*Improved Rat Trap.*—Patent dated February 7, 1850.—This invention consists in providing a box with a trap door and a sash

door, so connected and operated by means of levers, cog wheels, and springs, that, when the sash door falls, it also forces down the trap door; after which, by means of a simple mechanism, it immediately resets itself.

Claim.—Operating the doors B and C, by the rods and levers 2 u I¹, in combination with the cog sector F, and interrupted cog wheel E and click wheel G when operated by the spring L, or its equivalent, in the manner described and for the purpose specified.

No. 27,072.—AUGUSTE ROLLAND, of Toulouse, France.—*Improvement in Fertilizers.*—Patent dated February 7, 1860.—This compound is composed of the following ingredients: Alum, 7 parts; sulphate of iron, 29 parts; sulphate of soda, 36 parts; sulphate of lime, 25 parts, and 3 parts of sulphuric acid.

Claim.—The mode or method of manufacturing a fertilizing compound by the employment of the ingredients set forth, substantially as and for the purpose described.

No. 27,073.—W. H. ROUNDS, of Campello, Mass.—*Improved Machine for Trimming, Chamfering, and Skiving Leather.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with a feeding and gauging mechanism, the slotted arc H and knife stock I, so that the knife or cutter *f* may have the range of adjustment represented, to adapt the machine to the varied purposes mentioned, substantially as described.

No. 27,074.—CHARLES A. RUFF, of Boston, Mass.—*Improvement in Skates.*—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* an improved skate as made or provided with clamping devices, by which it may be clamped, substantially as described, to the edge of the sole or bottom edge of the sole and heel of the shoe or boot of a person.

I also claim the combination and arrangement of the toe clamp, the lateral lever clamps, the wedge, and the screw, to operate substantially as described.

I also claim the combination of the movable toe clamp with the heel abutment *a*, and the adjustable toe clamp, such clamps being provided with screws or equivalents for moving them, as described.

No. 27,075.—SOLOMON RUTHENBURG, of Indianapolis, Ind.—*Improvement in Shingle Machines.*—Patent dated February 7, 1860.—This invention consists in providing an alternate lever guide for producing a rocking movement in the block table, from which the point of the shingle is alternated from one end of the block to the other.

Claim.—The guide clicks *c c*, when constructed as set forth, in combination with the vibrating block table O, through lever L, operating in conjunction with my machine, substantially as set forth in the foregoing specification.

No. 27,076.—J. C. RUTHERFORD, of Derby Line, Vermont.—*Improved Solution for Toning Photographs.*—Patent dated February 7, 1860.—This solution is composed of the following ingredients: Corrosive sublimate, 2 drachms; tartaric acid, 12 drachms; sal soda, 2 drachms; hydrochloric acid, 30 drops; aqua dist., 12 ounces. After this solution is mixed it is allowed to stand forty-eight hours and then filtered, when it is ready for use.

Claim.—The toning solution composed of the within specified materials, combined in the manner and in about the proportions set forth.

No. 27,077.—S. W. RYCKMAN, of Pontiac, Mich.—*Improvement in Corn Shellers.*—Patent dated February 7, 1860.—This invention consists in the use of a rotary toothed cylinder, elastic bearing plates, inclined bed piece, endless feed apron, and a fan so arranged that corn shelling may be done in an expeditious manner.

The inventor says: I *claim*, first, the elastic apron G, provided with plates or buckets *g*¹ and strips *h*, in connection with the cylinder C, plates *f*, and inclined bed piece E; the whole being arranged for joint operation substantially as described.

Second. The yielding bar I, placed at the inner end of the feed trough H, and arranged to operate in combination with the apron G, as and for the purpose specified.

No. 27,078.—W. W. SKINNER, of Davenport, Iowa.—*Improved Machine for Bending Mould Boards for Ploughs.*—Patent dated February 7, 1860.—The stave I, flanges G G, and shaft F are made to revolve by means of a wheel N operated upon by pinion O on the shaft P, to which is attached a crank or arms for the purpose of operating the same.

Claim.—The stave I, (or staves I,) roller Q, bolts K, and movable set screw L, when combined, arranged, and operated in the manner and for the purpose set forth.

No. 27,079.—JOSIAH M. SMITH, of Somers, N. Y.—*Improvement in Sewing Machines*.—Patent dated February 7, 1860.—The stitch made by this machine is that known as the "double tambour stitch," each thread passing through the loop of the other thread, the second needle receding as the first one descends and passes through the loop formed by the second thread, and advancing as the first ascends to pass through the loop formed by the first thread.

Claim.—The arrangement of the bars C and G, and the connecting rod H, as shown, for the purpose of operating, at their proper times, the two needles, as described.

No. 27,080.—V. O. SPENCER and J. R. SPENCER, of Mansfield, Pa.—*Improved Animal Trap*.—Patent dated February 7, 1860.—This invention consists in the use of a revolving partition placed within a suitable box and provided with a treadle catch, bait box, and a discharge opening, whereby the device may be placed over a vessel containing water and the animals entrapped and destroyed at the same time.

Claim.—The revolving partition C within box A, actuated by the cord and weight, or its equivalent, the spring treadle or platform D with catch *h* attached, the bait box *l* and the opening *a* in the compartment *d*; the whole being combined and arranged as and for the purposes specified.

No. 27,081.—E. H. STEARNS, of Cincinnati, Ohio.—*Improved Method of Rossing Saw Logs*.—Patent dated February 7, 1860.—The rotary cutters revolve in the direction to strike under their axis against the direction of motion of the log, so cutting outward and throwing the dirt upon the surface instead of cutting through it.

The inventor says: I *claim*, first, the combination of the rotary and drawing cutters C V with a movable carrier A or R, made governable with reference to the uneven surface of the log, substantially as and for the purpose set forth.

Second. I claim the arrangement of the rotating roller G in combination with the lever L, or its equivalent, so as to be operated thereby substantially as and for the purpose set forth.

No. 27,082.—JOHN THOMSON, of Worcester, Mass.—*Improvement in Sewing Machines*.—Patent dated February 7, 1860.—This invention relates to the means of controlling the movements of the needle thread and concatenated second thread.

Claim.—The combination of the shield or needle guide *h* with the spring finger *i*, in the manner and for the purposes specified.

No. 27,083.—WILLIAM TINSLEY, of New York, N. Y.—*Improved Animal Trap*.—Patent dated February 7, 1860.—The escapement consists of a vertical pillar turning on pivots between two buckets attached to the end of the box, and at a point between the arbor of the wheel and the nearest side of the box; said pillar has three arms B C D projecting horizontally at different angles and points of elevation.

Claim.—I rest my claim upon the self-setting escapement of the pillar with its three arms, as set forth.

No. 27,084.—PHINEAS TOPHAM, of Newark, N. J.—*Improved Price Indicator*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a series of figures B, or its equivalents, a number of hinged strips *b*, with additional hinged strips *c*, or their equivalents, substantially in the manner and for the purpose specified.

No. 27,085.—ELMER TOWNSEND, of Boston, Mass.—*Improvement in Pegging Machines*.—Patent dated February 7, 1860.—This invention consists in preparing the blank to give the required point to the peg before splitting it from the blank; also, in an improved method of cutting the pegs from the blank as they are used in the machine.

The inventor says: I *claim*, first, pointing the peg on the pegging machine, substantially as described.

Second. I claim the inclined knives N, operating substantially as set forth, to cut the peg from the blank.

No. 27,086.—CHARLES B. WOOD, of New York, N. Y.—*Improvement in Safety Straps for Securing Carriage Thills*.—Patent dated February 7, 1860.—This invention consists in having cylindrical clips attached to the front axle of the vehicle, and encompassing both the bed and axles, and having eyes attached to the inner ends of the thills, which are fitted to the clips and allowed to turn freely thereon.

Claim.—The clips C, formed of two longitudinal parts *a b*, to admit of being securely fitted to the bed B and axle A, in connection with the eyes D attached to the thills, and arranged so as to encompass the clips, substantially as described.

No. 27,087.—CHARLES B. WOOD, of New York, N. Y.—*Improvement in Safety Straps for Securing Carriage Thills*.—Patent dated February 7, 1860.—This invention relates to an improvement in straps that are attached to the thills and axles of vehicles, in order to guard against accidents that might occur from the breaking of the permanent metal connections used for securing the thills to the axles.

Claim.—The strap F, formed by two parts *c d*, provided with a ring *e*, and applied to the axle and thills, substantially as and for the purpose set forth.

No. 27,088.—PHILANDER DANIELS, of Le Roy, N. Y., assignor to CLARK DANIELS, of said Le Roy.—*Improvement in Tanning*.—Patent dated February 7, 1860.—The claim explains the nature of this invention.

Claim.—An improved process of tanning, consisting in combining with the tanning solution tartaric acid, sal soda, and bichromate of potash, substantially in the order, proportion, and manner specified.

No. 27,089.—C. H. THOMPSON, of Orange, Mass., assignor to himself, GEORGE CARPENTER, and J. S. EMERY, of said Orange.—*Improved Tuyere*.—Patent dated February 7, 1860. This invention consists in the use and application to a tuyere of a straight forked valve, with one prong longer than the other, to operate, in combination with the openings *a b c*, in the top of the air box, so that one, two, or three of said openings, or one and part of the others may be used for admitting air.

Claim.—The forked valve E, constructed, arranged, and operating in combination with the perforated top of the air box, substantially as set forth and for the purposes described.

No. 27,090.—ALBERT C. RICHARD, of Newtown, Conn.—*Improved Wrench*.—Patent dated February 7, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The peculiar construction and arrangement of the screw wrench described, having the shank *a* made broad near the outer or fixed jaw *h*, and provided with the female screw or nut *f* as part of said shank, in combination with the sliding jaw operated by a screw, substantially as set forth, for the purposes described.

No. 27,091.—L. ACREE, of Taliaferro County, Ga.—*Improvement in Cotton Seed Planters*.—Patent dated February 14, 1860.—This invention consists in interposing between the main hopper, or seed container, and the toothed feed roll, a shaking hopper, that is agitated by the machine as it is drawn or pushed over the ground.

The inventor says: I *claim* the combination of the hopper H, shaking box G, and revolving feed roller F, arranged, combined, and operating together in the manner and for the purpose stated.

I also claim hinging the coverers to the main frame through the slotted hinges *v*, so that said coverers may follow the ground without being influenced by the frame, as set forth.

No. 27,092.—GEORGE C. AIKEN, of Nashua, N. H.—*Improvement in Cultivator Teeth*.—Patent dated February 14, 1860.—The tooth, consisting of the tenon *a*, vertical coulter A, mould boards or flanges C C, and smaller ploughs D D, are all made of iron and cast in a single piece. The front of the tooth is brought to an edge and shaped in the form of a sled runner, so as to pass more readily over obstructions.

Claim.—The combination and arrangement of the fixed plate B, vertical coulter A, flanges or mould boards C C, and cutters D D, substantially as set forth.

No. 27,093.—WILLIAM L. ALDRICH, of Atlanta, Ga.—*Improved Press for Attaching Leather to Billiard Cues*.—Patent dated February 14, 1860.—The engraving represents part of a cue fastened in the frame D to receive the leather, which is worked by the thumb screw mark A, under the lever E. C is the socket for the leather, worked by the thumb screw B.

Claim.—The combination and arrangement of the thumb screws A and B, frame D, lever E, and socket C, substantially as and for the purpose specified.

No. 27,094.—ETHAN ALLEN, of Worcester, Mass.—*Improvement in Machines for Making Percussion Cartridge Cases*.—Patent dated February 14, 1860.—This invention consists in an arrangement to trim the open end, to make all alike true, and also in striking up the swelled end to form the recess for the priming, as shown at Z, from that of Y, at one stroke, in contradistinction from spinning them.

The inventor says: I *claim*, first, the trimming mechanism composed of the sliding loose mandrel C, the revolving chuck mandrel S, and automatic tool, when constructed and operating substantially as described.

Second. I *claim* striking or forming the hollow rim at one stroke or operation, as above set forth and described.

No. 27,095.—HENRIETTA G. BATTY, of Springfield, Mass.—*Improved Spring Egg Cup*.—Patent dated February 14, 1860.—This invention consists in providing a small metallic standard with six or more elastic springs or arms, curved outwardly, and open at the top for the admission of the egg.

Claim.—The construction and arrangement of the elastic springs B B attached to the metallic standard A A, the movable pin or slide C C passing through the standard A A, in the manner and for the purposes substantially as set forth.

No. 27,096.—JOSEPH BERRY, of New York, N. Y.—*Improved Cut Nail Machine*.—Patent dated February 14, 1860.—This invention consists in the combination of a rotating cutter head provided with a series of cutters set obliquely in reverse directions, alternately, to the plane of the face of the cutter head, and an anvil and die oscillating on an axis perpendicular to the axis of the rotating cutter head.

The inventor says: I *claim*, first, the arrangement of the cutters *a* upon the face of the cutter head F, near the centre thereof, substantially as and for the purpose shown and described.

Second. The arrangement of the vibrating anvil J, cam-shaped groove G, anvil shaft K, arm P, rod M, lever Q, as and for the purpose shown and described.

No. 27,097.—HARRIS BOARDMAN, of Lancaster, Pa.—*Improvement in Metallic Carriage Hubs*.—Patent dated February 14, 1860.—This invention consists in having a metallic hub with chambers to receive the spokes, and the arrangement of clamp plates and wedges for tightening the spokes.

Claim.—The arrangement and combination of the clamp plates E and wedge D as attached to the chambered metallic hub, substantially as described and for the purposes set forth.

No. 27,098.—EDMUND BRICKETT, of Minot, Me.—*Improved Braces for Harness Breeching and Breast Plates*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to harnesses of metallic breeching and breast plate braces, with the rings and shanks connecting with the braces, as described, using for that purpose the aforesaid metallic substance, or any other metallic substance suitable for that purpose.

No. 27,099.—ROBERT H. BROOKS, of Greenville, Ga.—*Improvement in Ploughs*.—Patent dated February 14, 1860.—P P are flat pieces of iron attached by bolts or rivets to each side of the beam A at Q, and, extending back, are connected with the screw bolt G, with the standard C and the handles E E. By this arrangement the opening R in the end of beam A is formed. The standard B passes through the opening R, and by the action of the screw bolt F it is held firmly in its place.

Claim.—The arrangement of braces D D C, holes H O V I, screw bolt T, pieces P P, opening B, beam A, standard B, heel screw W, notch X, and opening g, constructed as described for the purposes set forth.

No. 27,100.—ROBERT F. BROWER, of New York, N. Y.—*Improved Rotary Steam Engine*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The methods or devices, substantially as described, which serve as steady and regular points of counter resistance to the direct action of steam, when employed in a series of diverging cylinders, which revolve eccentrically to the centre of motion of the driving wheel, without the aid of any other separate movable parts, such as valves or springs.

No. 27,101.—THOMAS W. BROWN, of Boston, Mass.—*Improved Twine Holder*.—Patent dated February 14, 1860.—In constructing the stand and box each is to be formed in two separate parts a^1 , b^1 , each of the parts a^1 being arranged directly over and affixed to one of the parts b^1 , and each two parts $a^1 b^1$ being cast or formed in one solid piece of metal or other suitable material, as shown in the engravings.

Claim.—The improved twine holder, as made substantially in manner and so as to operate as described.

No. 27,102.—JOEL BRYANT, of Brooklyn, N. Y.—*Improvement in Grinding Mills*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, in the construction of portable grinding mills the cog wheels C^1 , C^2 , and C^3 , when constructed, set, and operating in connection with each other, and the cylinders A and B of the said mills, substantially as described and for the purposes set forth.

Second. And, in connection with the above, I claim the making, setting, and gearing of the body M of portable grinding mills, so as that the said mills (Fig. 1) may be set to run and

grind at any desirable plane of the horizon, either vertical, or horizontal, or oblique, substantially as described and for the purposes set forth.

No. 27,103.—RICHARD B. BURCHELL, of Brooklyn, N. Y.—*Improved Mosquito Nets and Shades for Windows*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Attaching a window shade or mosquito net C to a roller B and rods $a^1 a^1$, which are fitted in tubes c c, said shade or net having its lower end attached to a bar D provided at its ends with double guides or gibbs E, which are fitted on rods $a^1 a^1$, the whole being applied to the window frame and arranged to operate as and for the purpose set forth.

No. 27,104.—JOHN F. BURGIN and AUGUSTUS KOCH, of Williamsport, Pa.—*Improved Hydraulic Engine*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement for converting the rectilinear alternate motion into a rotating one by means of water or any other non-elastic fluid whose force, derived from an artificial pressure, causes a wheel to turn around its axis, as described.

No. 27,105.—SAMUEL BUSER and JOHN H. BUSER, of Warren, Ill.—*Improvement in Harvesters*.—Patent dated February 14, 1860.—This invention relates to a novel cutting device, and an improved arrangement of means for regulating the position of the same to determine the height of the cut and to facilitate the raising and lowering of the cutting device, so that it may pass over any obstructions that may be in its path.

Claim.—The combination of the frames A E hinged at c c, with the elevating devices, viz: the rack bar I, shaft o, chain M n, and sliding castor wheel O, arranged to operate in the manner and for the purpose shown and described.

No. 27,106.—ABNER CAREY, of Rome, Ga.—*Improvement in Cultivators*.—Patent dated February 14, 1860.—This invention relates to that class of implements having one or more pairs of ploughs or shares adapted to hilling up the ground, and consists in an arrangement by which the ploughs, being adapted to be adjusted in working depth, may also be capable of receiving adjustment laterally, so that the ploughs may be set to work at any distance apart within the compass of the frame.

Claim.—The described arrangement of the ploughs H, beams G, and perforated rails D, the whole being constructed and combined in the manner and for the purposes set forth.

No. 27,107.—ABNER CAREY, of Rome, Ga.—*Improvement in Cotton Seed Planters*.—Patent dated February 14, 1860.—The operation of this invention is thus described: The hopper E being supplied with seed and the clutch pulleys c and b thrown in gear, the machine is drawn forward, the effect of which is to rotate the hopper E and picker K in the same direction, causing their adjacent parts to move in opposite directions, as indicated by the arrows. By this means the seed is taken from the hopper in a continuous and uniform stream, and through the agency of the spout M and tube N, deposited in the furrow formed by the tooth O, after which it is immediately covered and the earth compacted sidewise about it by the double conical roller P.

Claim.—The combination of the horizontal conical hopper E and duplex, saw-shaped feeder K, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 27,108.—JOSEPH B. CHARLES, of Ashland, Ohio.—*Improvement in Fan Blowers*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Giving a concave or recessed shape to the faces of the fanning wings f at the same time that the oblique eduction apertures i i are formed opposite said wings, in the sides of the fanning chamber, substantially in the manner and for the purpose set forth.

No. 27,109.—ELIJAH B. CLARKE, of Tallahassee, Fla.—*Improvement in Ploughs*.—Patent dated February 14, 1860.—This invention consists in a combination of diagonal cross bars with a longitudinal brace, the whole being bolted together and secured rigidly to a plough beam in such a manner as to form a braced standard for the shovel, admitting of its being readily attached and detached.

Claim.—The arrangement of the longitudinal bar D, shovel E, double brace C^1 , double brace C, bolt c, projection d, beam A, and handles B, as and for the purpose set forth and described.

No. 27,110.—HENRY E. CLINTON, of Woodbridge, Conn.—*Improvement in Carriage Thill Attachments*.—Patent dated February 14, 1860.—This invention consists in constructing the

shaft eye so as to hook upon the jack bolt, and is secured in its place by means of a spring key, thus doing away with the nut and screw which is now in use.

Claim.—The application of the spring key B, substantially, and for the purposes, as is herein set forth.

No. 27,111.—JOHN W. COLEMAN, of Medway, Mass.—*Improvement in Stoves.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the sliding doors B and B with the stove A and oven G, so that the heat from around the cylinder of the stove may be confined within or entirely cut off from the oven, by closing or opening said doors in the front or back of the stove, the whole being constructed and operated substantially in the manner and for the purpose set forth.

No. 27,112.—THOMAS DANIELS, of Toledo, Ohio.—*Improvement in Stop Cocks.*—Patent dated February 14, 1860.—Between the partition K and the perforated partition or disk I is a common chamber L into which the syrup flows through the valves M, the syrup being discharged from said chamber through the tube C. The several valves M are inserted into valve seats made in the disk I, the number corresponding to the number of small tubes.

Claim.—The arrangement of the several syrup and water tubes provided with valves, as shown, in combination with the common discharge chamber L and tube C, substantially as set forth, for the purposes described.

No. 27,113.—JOHN DAVIS and STURGIS CHADDOCK, of Boston, Mass.—*Improvement in Gas Retorts.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, the movable flues B constructed and applied as described, in connection with the door C and its flue or projection D, and the collar of the retort, substantially in the manner and for the purpose as described.

Second. We claim the peculiar construction of the door C, with its projection or flue D, in connection with the collar of the retort and the movable flues B, the whole being applied to the interior of the retort, and operating together substantially in manner and for the purpose as set forth.

Third. We claim the combination of the safety valve with the flue D of the door C, in manner and for the purpose as specified.

No. 27,114.—LOUIS DE MASURE, of New York, N. Y.—*Improvement in Safety Studs.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the movable plate *h*, which, after the stud is placed within the button hole, is capable of advancing towards or receding from the front or top plate *c*, guided by the circular rods *ff*, by means of a turning or revolving plate *c*.

Second. I claim the plate *g*, provided with circular rods *ff*, and fitting loosely upon the screw stem *e*.

Third. I claim securing the pointed pins *ii* into the plate *g*, (a plate separate from the front or top plate *c*,) so as to cause them to enter the cloth in the operation of securing the stud to the same.

No. 27,115.—B. WELLS DUNKLEE, of Boston, Mass.—*Improvement in Cooking Utensils.*—Patent dated February 14, 1860.—The object of this invention is to produce an apparatus which shall carry away the steam and disagreeable odors rising more or less in all cooking operations.

Claim.—The cover as constructed with an outer casing A, and with an inner casing B attached thereto, substantially, and for the purpose, as specified.

No. 27,116.—LEOPOLD EIDLITZ, of New York, N. Y.—*Improvement in Photographic Bank Notes.*—Patent dated February 14, 1860.—The claim explains the nature of this invention.

Claim.—The use of the photographic process, as a substitute, either wholly or in part, for engraving or printing bank notes, or other instruments requiring security against counterfeiting, in combination with the employment of paper bearing either a pressed mark or a water mark, produced as described, or by any similar means.

No. 27,117.—JOSIAH S. ELLIOTT, of West Needham, Mass.—*Improvement in Brick Presses.*—Patent dated February 14, 1860.—This invention relates to an improvement in brick presses for forming bricks from sand and lime, or other suitable material.

The inventor says: I claim, first, the carrier O, operated substantially as described.

Second. I claim clutching the cam D to the wheel G, in the manner substantially as shown, for the purpose specified.

No. 27,118.—E. P. FARRAR, of New York, N. Y., and J. N. FARRAR, of Pepperell, Mass.—*Improvement in Water Meters*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, in combination with a mouth piece constructed as described, the arrangement of any suitable number of radial and inclined tubes applied to said piece in such a way that each will eject its equal share of water; this we claim in combination with the box H, deflecting plates *r*, one over each tube, and secondary box M; all arranged substantially in the manner and for the purposes set forth.

Second. We claim, in combination with the air-tight casing and tilting or measuring vessel, or its equivalent, the secondary receptacle M, communicating with the top of case N¹, and arranged in connection with the inlet pipe G, substantially in the manner and for the purposes described.

No. 27,119.—LUCIUS N. FAY and WILLIAM MASON, of Warren, Mass.—*Improvement in Blind Operators*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: We *claim*, first, the combination of the screw shaft *b*, rack *e*, pinion *g*, and slotted arm *h*, applied to the window casing and blind, substantially as and for the purpose set forth.

Second. The shaft *k* having the spiral spring *l* placed on it, and provided with a bent arm O, and projection *j*, the latter being fitted in the slotted arm *h*, in connection with the hooked plate *q*, the above parts being used with or without the slide bolt *t*, substantially as and for the purpose specified.

No. 27,120.—PETER FLICKENGER, of Hanover, Pa.—*Improvement in Harvesters*.—Patent dated February 14, 1860.—This invention consists in having the tongue of the harvester passing through the draught frame, and secured by a washer in the rear of the tongue, which has a curved face fitting into a bed formed in the rear cross piece for its reception, the said piece being cut away on both sides around the opening, so as to leave the tongue free to conform to the vertical movement of its front extremity without bending.

Claim.—The tongue T, constructed with the shoulders *c c*, and ballwasher B, on the rear extremity, in combination with the front and rear cross beams of the frame, having the openings O in the one, and slot S in the other, substantially as and for the purpose set forth.

No. 27,121.—JAMES M. FREEMAN, of Belleville, N. Y.—*Improvement in Carriage Tops*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arm A with its button D, or its equivalent, which will allow the carriage top to be raised or lowered without buttoning or unbuttoning or injuring the curtains to the top, and allow at the same time the top to be extended forward so as more completely to protect the person from storms and inclement weather.

No. 27,122.—AARON W. GEAHEART, of Beallsville, Ohio.—*Improvement in Bee Hives*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the strips *a b* and *c*, so as to produce a galvanic current between the hive and its platform, or other support, in the manner and for the purpose specified.

No. 27,123.—W. G. GREELEY, of Hingham, Mass.—*Improved Machine for Cutting Out the Uppers and Soles of Boots and Shoes*.—Patent dated February 14, 1860.—This invention consists in the use of a reversible block or cutter holder, in connection with a movable bed piece fitted within a suitable framing, whereby the uppers and soles of boots and shoes may be cut from the leather or stock.

Claim.—The reversible block or cutter holder *n*, attached to an adjustable handle F, and used in connection with a movable bed piece B, operated by the toggles C C, and treadle E, or their equivalents, substantially as and for the purpose set forth.

No. 27,124.—SHELDON GUTHRIE, of New Orleans, La.—*Improvement in Lamps*.—Patent dated February 14, 1860.—The claim explains the nature of this invention.

Claim.—This new and improved arrangement of tubes, or burners, and wicks for burning all kinds of common oil, grease, fluids, &c., for the purpose of producing artificial light, as substantially set forth and described, the same being applicable to tubes of any size in proportion to the degree of light desired.

No. 27,125.—J. O. HARRIS and W. F. SLEWDER, of Ottawa, Ill.—*Improvement in Cultivators*.—Patent dated February 14, 1860.—This invention relates to the manner of constructing and combining the plough stocks and the frame of the implement so that the positions of the

ploughs can be adjusted or reversed to adapt it to the cultivation of corn at different stages of its growth.

Claim.—In combination with a V shaped adjustable and reversible frame, the adjustable and hinged plough stocks B, when constructed and arranged substantially in the manner and for the purpose described.

No. 27,126.—FRANCK I. HENKELL, of New York, N. Y.—*Improved Secretary Table.*—Patent dated February 14, 1860.—This invention consists in arranging on both sides of a table hinged flaps, which are connected to a common swivel head in such a manner that they allow of being turned to a vertical or to a horizontal position; and which, when turned to a vertical position, serve to conceal the real nature of the table, and when in a horizontal position they may be used for placing such articles thereon as would be in the way when placed on top; and, also, in combining a looking glass with a table top.

The inventor says: I *claim*, first, the arrangement of the hinged flaps C, in combination with the frame A of a table, and with the swivel head D, or its equivalent, constructed and operating substantially as and for the purpose described.

Second. The combination of the hinged table top E, looking glass G, and writing desk H, with the frame A and flaps C, substantially in the manner and for the purpose specified.

No. 27,127.—GUSTAV HEYDRICH, of Philadelphia, Pa.—*Improved Fire Escape.*—Patent dated February 14, 1860.—This invention consists in the employment of a shaft and drum having bearings permanently fixed inside of the cornice of buildings, and upon which a rope or chain ladder may be wound and thus always kept free from injury when not in use, and in case of danger from fire inside of the building, easily accessible from the windows, and the rope or chain ladder unwound.

Claim.—The described apparatus for saving lives and property in cases of fire, when the same is permanently attached to the cornice of the building, and constructed and operating substantially in the manner and for the purpose set forth.

No. 27,128.—BIRDSILL HOLLY, Lockport, N. Y.—*Improvement in Pumps.*—Patent dated February 14, 1860.—This invention consists in a method of connecting the lower valve with the piston, by which the latter is made to raise the valve from its seat, and thereby effect the drainage of the cylinder when required.

Claim.—Connecting the valve H to the piston D, by means of the rod g, or its equivalent, hollow piston stem E, and regulating nut a, arranged and operating substantially in the manner and for the purpose shown and described.

No. 27,129.—WILLIAM H. HOWARD, of Philadelphia, Pa.—*Improved Machine for Serrating the Surfaces of Rollers.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Serrating the surfaces of metal bars or rollers by means of a screw-cutting die J, and a milling roller K, arranged in respect to, and operating simultaneously on, the said bar, substantially as set forth.

No. 27,130.—CHARLES S. IRWIN, of Madison, Ind.—*Improvement in the Manufacture of Starch.*—Patent dated February 14, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim*, first, in the manufacture of starch from maize or Indian corn, an improved method of treating the corn, preparatory to its being crushed and ground, by steeping the same in water heated to an average temperature of 160° Fahrenheit, or to any other temperature ranging between 145° and 180° Fahrenheit, said water being, as usual, changed from time to time so as to maintain the requisite temperature, and to remove the water acidulated by previous fermentation of the corn, substantially in the manner and for the purposes set forth.

Second. In the manufacture of starch from maize or Indian corn by steeping the whole and uncrushed corn in water heated to a temperature of from 70° to 180° Fahrenheit, and by then grinding it with water heated to a temperature of from 70° to 140° Fahrenheit, I *claim* the method described of effecting the separation of the starch from the gluten in a more perfect manner than this has been done heretofore, by maintaining the temperature of the starch water while in the runs, at, or heating the same previous or during the separation of the starch from the gluten to, an average temperature of 60° Fahrenheit, or to any other temperature ranging between 55° and 70° Fahrenheit, substantially in the manner and for the purposes set forth.

No. 27,131.—GEORGE W. JENNINGS, of Boston, Mass.—*Improved Laundry and Taylor's Press.*—Patent dated February 14, 1860.—This invention consists in arranging a horizontally movable iron, with a vertically moving table, to bring the work up to it so as to give perfect command over both, with a powerful pressure.

Claim.—The combination and arrangement of the movable table or arm and the levers or toggle joint for operating the same, to bring the work up to the movable or revolving iron, when constructed and operating in the manner and for the purposes as set forth and described.

No. 27,132.—GEORGE JUENGST, of New York, N. Y.—*Improvement in Sewing Machines.*—Patent dated February 14, 1860.—This invention consists of a novel method of driving a needle by a crank motion, which causes its movement to be accelerated and retarded at different stages, in the manner best adapted for the formation of the loops in its thread, and the production of perfect sewing. It also consists in a certain construction of the shuttle-driver, and in certain contrivances in combination with which it operates.

The inventor says: I *claim*, first, the combination of the rotating shafts F K, one of them carrying a revolving arm J, and the other two revolving cranks G H, when the said shafts, arm, and cranks are arranged and operated as shown and described.

Second. The shuttle driver, with its jointed horn *j*, ear *r*, and spring *p*, applied and operating in combination with the guide *m n¹ o*, on one side of the shuttle race, and operating substantially as described.

No. 27,133.—EMIL KELLERMANN, of Moosop, Conn.—*Improvement in the Manufacture of Tufted Work.*—Patent dated February 14, 1860.—By this invention the threads to be worked in the moulds are dressed in a common dressing frame in the same manner as common warps. They are passed through the loop H of the wire rope I, and the crank is set in motion. When the figures C C are filled, the iron rod D is removed, and the whole set of moulds are cut by two and two, or by pairs, and cemented on each side. When dry, these are cut apart.

Claim.—The employment of a series of metallic plates A, when arranged, combined, and operating in the production of tufted work, as shown and described.

No. 27,134.—J. M. KENDALL, of South Hardwick, Vt.—*Improved Feed Motion for Boring or Mortising Machines.*—Patent dated February 14, 1860.—This invention relates to an improved machine, designed for mortising large timber for framing, and where an auger is required, in connection with a chisel, in order to form the mortises.

Claim.—The pawl Q, attached to the frame A, engaging with the rack *e*, and operated by the cross-bar *f* of the sash or gate I, for the purpose specified.

No. 27,135.—CHARLES KINZLER and WILHELM ROSEBUCK, of New York, N. Y.—*Improved Sugar Cutter.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of two plates, provided with knives forming square openings, and capable of moving towards and from each other, for the purpose of cutting or cracking the slabs of sugar into regular morsels, in combination with fixed frames provided with points which enter the openings in said plates, when the latter are receding, for the purpose of pushing the morsels or pieces, which may adhere to the knives, out of the holes, and operating together in the manner and for the purpose substantially as described and specified.

No. 27,136.—THOMAS LOVELIDGE, of Philadelphia, Penn.—*Improvement in Looms.*—Patent dated February 14, 1860.—This invention consists of an escapement or pallet wheel, secured to the warp beam, a weighted pallet lever, an arm, and a catch, in combination with two stationery rollers, and a movable weighted bar, the whole being arranged for joint action so as to let off the requisite amount of work from the beam, and at the same time maintain it at a uniform tension.

Claim.—The escapement or pallet wheel H, on the end of the warp beam, the weighted pallet lever I, the arm J, and catch *f*, in combination with the rollers *n* and *n¹*, and the weighted bar *m* or its equivalents, the whole of the parts being arranged for joint action, as and for the purpose set forth.

No. 27,137.—DANIEL LOVEJOY, of Lowell, Mass.—*Improvement in Spring Skates.*—Patent dated February 14, 1860.—This invention consists in providing joints at the heel and toe of the runner of the skate, which joints form a connection between the runner and the springs, the springs being fastened to the wood or stock of the skate.

Claim.—The combination of the runner C, the joints D and D¹ at the heel and toe thereof, and the springs E and E¹, which connect said joints and runner with the stock of the skate, for the purpose and substantially as described.

No. 27,138.—JOHN W. MACKENZIE, of San Francisco, Cal.—*Improved Apparatus for Freeing Ships' Holds from Water.*—Patent dated February 14, 1860.—This invention consists in constructing the ship with a series of valved chambers at her stern, bow, and sides, and in communication with a ship's hold and certain discharge passages, so that when the

ship pitches fore-and-aft, or rolls heavily, any water, which flows into her hold by reason of leaks shall be automatically raised therefrom and discharged into the sea.

Claim.—The arrangement of compartments $a^1 a^2 a^3 a^4 a^5$ and valves ff^1 , &c., in relation to and in communication with a ship's hold A, and discharge passages c, constructed as and for the purposes described.

No. 27,139.—J. P. MANTON and H. A. BILLINGS, of Providence, R. I.—*Improvement in Hanging Rudders.*—Patent dated February 14, 1860.—The object of this invention is to hang the rudder in such a manner that it will work with but little friction, and still be properly supported and firmly secured to the vessel.

Claim.—The combination, with the rudder head C and hull A, of the plates D E, when the latter are flanged, as shown, to prevent surging, and provided with grooves $f g$, with friction balls h interposed, as and for the purposes set forth and described.

No. 27,140.—H. MARANVILLE, of Clinton, Ohio.—*Improvement in Coin Detectors.*—Patent dated February 14, 1860.—This invention is intended to test the weight and dimensions of gold and silver coin, and consists in combining a slide, marked with suitable scales, with a plate which is furnished with two knife edges on its under side, and with two projections above in such a manner that the standard weight of a certain coin, placed against the two projections on the upper side of the plate, turns the same on the above-named edges, and raises the slide, when the latter is drawn out to a certain point which is marked to correspond with the coin in question.

Claim.—The arrangement of the plate A, with diameter scale c, and incisions $d d^1$, and with knife edges b , in combination with the slide B marked on one side for gold, and on the other side for silver coins as described, and operating in the manner and for the purpose specified.

No. 27,141.—CHARLES McCAMMON, of Albany, N. Y.—*Improvement in Constructing Bars of Cast or Wrought Iron.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combining of wrought iron with cast iron in the formation of bars, by the process and for the purposes set forth and described in the specification.

No. 27,142.—ISAAC M. MILLBANK, of Greenfield Hill, Conn.—*Improvement in the Apparatus for Manufacturing Oxide of Zinc.*—Patent dated February 14, 1860.—This invention is intended to include the manufacturing of any volatile metal for which it may be found applicable.

Claim.—The combination and arrangement of the furnace A with metal top, accessible openings d and e , and the flues $b b$ in connection with the perforated pipes $c c$, the chute f , the receptacle j , the duct B B with its reticulated surface K, the collecting or saving apparatus with the apartment C, to be managed and used as described in the specification.

No. 27,143.—WILLIAM MOSHER, ISAAC H. MOSHER, and JOHN J. HARRIS, of Green, N. Y.—*Improvement in Machines for Bending Tire.*—Patent dated February 14, 1860.—This invention consists in the use of a wedge or tapering key to control the length of the lever that holds a roller to press upon the bar adjusting it to the necessary thickness, and the scroll-shaped former to hold the bar so that the roller will pass over the lap and complete the bending at one operation.

Claim.—The scroll-shaped stationary former, the mode of holding the end of the bar to be bent, the manner of adjusting the friction roller by the wedge-shaped key through the lever bearing against the centre bolt, all in combination as specified, and for the purposes set forth.

No. 27,144.—THOMAS MURPHY, of Cincinnati, Ohio.—*Improvement in Cultivators.*—Patent dated February 14, 1860.—A is the beam provided with a clevis B, by which it is drawn. It is mortised to the standard C, and both have connection with the bracing standard D, to which the handles E are connected. F is a common shovel plough share connected to the standard C and braced to the beam A by G. H H¹ are staples through which the adjusting rods of the mould boards and cultivator frames respectively pass for fastening.

Claim.—The described arrangement of the plough frame A C D E F, detachable mould-boards K, and detachable cultivator frames N O, the whole being constructed and operating in the manner and for the several purposes set forth.

No. 27,145.—WALTER NANGEL, of Philadelphia, Pa.—*Improved Mortising Machine.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of rotary reciprocating cutters in mortising machines, substantially in the manner and for the purpose set forth.

No. 27,146.—CHARLES NEAMES, of New Orleans, La.—*Improvement in Bagasse Furnaces.* Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the use of chambers in wet fuel furnaces which have their receiving openings exclusively in and from the interior of the furnace, to receive the vapors arising from the fuel, and which will convey and distribute the same at points to meet the carbonaceous gases, to allow the oxygen from the vapor to be brought in contact with highly heated carbon, to support combustion.

I also claim the hollow pillars mounted on wall A, in combination with flue c, when arranged and operated as and for the purpose set forth.

No. 27,147.—EDWARD O. C. ORD, of the United States Army.—*Application of Gunpowder to Flat Projectiles, giving them Rotation.*—Patent dated February 14, 1860.—This invention consists in giving, by an explosive force, an impulse to oblate or flat projectiles, and thereby communicating a motion of translation and one of rotation in, and parallel to, the planes of greatest oblateness of the projectiles.

Claim.—The use and control of flat projectiles discharged from fire arms, or not by hand, and rotating in their flight, substantially as described.

No. 27,148.—JOSEPHUS PARSONS, of Carthage, Ohio.—*Improved Rotary Steam Engine.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction and arrangement of the wheel B, provided with radial shuttle valves D, and the steam chambers, the said valves and the wheel itself being operated by steam, in combination with the cams, which also serve as stationary pistons, substantially as set forth, for the purposes described.

No. 27,149.—W. A. PATRICK, of Ludlow, Vt.—*Improved Method of Operating Feed Nuts in Lathes.*—Patent dated February 14, 1860.—This invention relates to an improved means for operating or adjusting the two parts of a divided nut, so that the same may be made to engage with or be disengaged from the feed screw, which, when the nut is engaged with it, gives the feed movement to the carriage containing the knife.

Claim.—The yoke C, connected with the hand lever E and spring F, and also connected with the sliding plates *b b* of the sections *c c* of the nut, by means of the pins and slots *e e d d*, the whole being arranged to operate as and for the purpose set forth and described.

No. 27,150.—N. A. PATTERSON, of Kingston, Tenn.—*Improvement in Harrows.*—Patent dated February 14, 1860.—This invention consists in attaching the teeth of the implement to shafts, which have a vibratory movement imparted to them as the implement is drawn along, for the purpose of relieving it from the trash, weeds, &c.

Claim.—The arrangement of the shafts or side rails D, with the mechanism for vibrating them, substantially as and for the purposes set forth and described.

No. 27,151.—EDMOND PEEK, of San Jose, Cal.—*Improvement in Harvesters.*—Patent dated February 14, 1860.—This machine is turned and guided by means of the shaft *j¹*, pinion *i¹*, and semi-circular rack *h¹*. As the driver stands on the platform *l*, the spring plates *n¹ n¹* of the lever *o¹* and the lever N are within his reach, and may be operated with facility.

Claim.—The arrangement of the vertical rod *j¹*, racks *m¹ m¹*, lever N, spring plates *n¹ n¹*, rods *o o¹*, perch J, apron box F, axle I, and clutches *j p*, as and for the purpose shown and described.

No. 27,152.—C. M. PLUMB, of North Orange, N. J.—*Improved Time Table for Railroads, &c.*—Patent dated February 14, 1860.—The object of this invention is to obtain a cheap and ready reference time table for railroad stations, for giving information to persons travelling over certain routes, and to serve as a perpetual railroad directory, showing the time of departure of the trains leaving the station during the day or night.

Claim.—The within described construction of frame and movable slides, with the separate movable plates with letters or numerals denoted thereon, the whole being combined, arranged and operating for the purposes and in the manner described.

No. 27,153.—CHARLES POPE, of Syracuse, N. Y.—*Improvement in Apparatus for Evaporating Saline Liquors.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the hollow angle pieces constructed and arranged substantially as described and for the purpose set forth.

I also claim making the arms of the kettles hollow, as set forth, and for the purpose stated.

I also claim combining the hollow angle pieces with the air spaces D upon the sides of the arch, when so arranged that heated air may pass from the spaces upward through the angle pieces, and be discharged over the boiling liquid in the kettles, as set forth.

No. 27,154.—D. J. POWERS, of Madison, Wis.—*Improvement in Straw Cutters*.—Patent dated February 14, 1860.—This straw cutter has its knives arranged on a revolving cylinder so as to cut upward against a stationary revolving blade. The lower feed roller, which is fluted and made of metal, is adjustable in a curved slot, and is so arranged with four gear wheels that it is always in gear with the driving mechanism. A weighted lever holds the feed roller with a yielding pressure against the upper fluted metal feed roller on the straw passing between the two rollers.

The inventor says: I *claim*, first, the arrangement of the adjustable ledger blade I J, in combination with the upward cutting knives G of the cylinder D, curved slot R, compensation pinions Q¹ Q² Q³ Q⁴, weighted lever S, and feed roller M, substantially as and for the purposes set forth.

Second. The arrangement of the cone or gear wheels L, on the feed roller shaft, with the compound pinion C of the knife cylinder, substantially as and for the purpose, set forth.

No. 27,155.—THOMAS E. PURCHASE, of Danville, Pa.—*Improvement in Grates for Furnaces*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a series of comb like bars each interlocking the other and capable of being oscillated independently of the other, substantially as specified, for the purposes set forth.

No. 27,156.—JOSEPH REYNOLDS, of Providence, R. I.—*Improvement in Marine Propellers*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The double cranks supported by outside bearings, with the propeller frames supported by stay rods and guided at the top with two radius rods to each frame hung to the vessel, or suitable frames attached to the vessel abaft the main shaft to which the propeller frame is connected, the radius rods to be of a suitable length and hung in a proper position to hold or guide the top of the frame forward, or beyond the shaft to which it is attached, the whole constructed and arranged substantially as and for the purposes specified.

No. 27,157.—AARON RING, of Westbrook, Me.—*Improvement in Seeding Machines*.—Patent dated February 14, 1860.—This improvement is explained by the claim and engravings.

Claim.—The combination of the wheel A, which is open at both ends, with wheel B, both wheels placed upon the same axis and rotating in opposite directions in combination with two shafts C and D, one within the other, substantially as and for the purpose set forth.

No. 27,158.—WILLIAM ROBOTHAM, of Newark, N. J.—*Improved Gag Runner*.—Patent dated February 14, 1860.—The object of this invention is to give strength to a part hitherto weak, and in so placing the loop as to add to the beauty of the attachment.

Claim.—Constructing the two loops in one piece and arranging them substantially as described.

No. 27,159.—FISK RUSSELL, of Manchester, N. H.—*Improvement in Mowing Machine Cutters*.—Patent dated February 14, 1860.—This invention is to so form the cutters that there cannot be any loose grass drawn under them, or between them and the guard fingers, to clog or in any way retard their motion.

Claim.—The combination of the wings or projections C, with the blades A, when the latter are pivoted and when the said projections are arranged to operate in connection with the guards as and for the purpose set forth.

No. 27,160.—THOMAS SAULT, of Seymour, Conn.—*Improvement in Rollers for Making Caoutchouc and Allied Gums*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The breaking down, comminuting, and cleaning of crude commercial vulcanizable gums, separating them from foreign bodies by toothed rollers, substantially as set forth, whether the rollers be in pairs or in threes or any other number.

No. 27,161.—WILLIAM M. SLOANE, of Buffalo, N. Y.—*Improved Machine for Dressing Staves*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the feed roller N, having the gauge n, in combination with the cutters J J, when the said feed roller is so placed and arranged with reference to the cutters and other parts of the machine as that the stave will be fed to the cutters, in such relative time and motion, as to cause the middle of the stave to be dressed while the cutters are in their lowest position, substantially as herein described.

Second. I claim the combination and arrangement of the gauge n, with a pressure or feed roller N, whose circumference is equal to or greater than the length of the longest stave to be dressed, the said gauge being adjustable on the face of the roller so as to cause the middle of a long or short stave to be dressed by the cutters while in their lowest position, substantially as set forth.

Third. I claim the relative arrangement of the annular rim or feed bed B, friction rollers E E¹ and E², and the pressure rollers T and T¹, for the purpose set forth.

Fourth. I claim the combination of the rotating bed, having a roughened surface, with the pressure rollers T and T¹, for the purpose and substantially as described.

No. 27,162.—JONATHAN SMITH, of Tiffin, Ohio.—*Improvement in Seed Drills*.—Patent dated February 14, 1860.—In this invention while the corrugated wheels, which are so arranged as to give a zigzag motion to the grain or seed, the ratchet formed edge of the washers has the tendency to force the grain downwards, at the same time facilitating the zigzag movement given by the corrugated wheels to force the grain through the discharge holes.

Claim.—The thin metal corrugated wheels D, and ratchet washers E, conforming therewith in lateral surfaces, in combination with shaft A, collars F, and concave hopper bottom B, the operation being as set forth.

No. 27,163.—WILLIAM W. SPAFFORD, of Petersborough, N. H.—*Improvement in Railroad Car Wheels*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the car wheel formed with curved or corrugated shell side surfaces c c d d, and internal diaphragms or partition f f f f, forming one or more internal cells, cavities, chambers, or spaces g g h h, when said surfaces and diaphragms are so arranged as that the incumbent downward weight or pressure acting thereon shall be in a direction vertically throughout said parts of the wheel, substantially as set forth and described.

No. 27,164.—OTIS W. STAMFORD, of Cincinnati, Ohio.—*Improvement in Grinding Mills*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of grinding surfaces composed of spiral ridges, separated by cavities which shoal or feather diagonally, as set forth.

No. 27,165.—DANIEL D. STELLE, of New Brunswick, N. J.—*Improved Acoustic Apparatus*.—Patent dated February 14, 1860.—The engraving represents the funnel shaped receiver a a, which collects the sound, of an elliptical form at its mouth which fits an opening in the top of the pulpit B, and gradually assuming a circular form toward the bottom, where it terminates in a circular throat b, from which a pipe c runs under the floor A to the point d, where it is led upward through the floor to connect with a taper flexible tube e, at the end of which is a suitable ear piece g to be placed in the ear of the person requiring it to conduct the sound thereto.

Claim.—The combination with a pulpit or reading table, of the sound receiver a a, and conducting tube c, substantially as and for the purpose shown and described.

No. 27,166.—GEORGE K. SNOW, of Watertown, Mass.—*Improvement in Folding Paper for Book Binders*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* folding each sheet with back folds and into two connected signatures having their connection along or adjacent to and between the front edges to be trimmed, and so that the said connection may be trimmed or separated with such front edges from the rest of the paper while they are trimmed; my process involving the back folding of the sheet one or more times in making the first folding, and the back folding of it twice or other suitable greater number of times in making the second folding, or that which is at right angles to the first folding.

No. 27,167.—JOSEPH STORM, of Woonsocket, R. I.—*Improvement in Paper Rag Engines*.—Patent dated February 14, 1860.—This invention relates to improvements in that class of rag

engines in which a rotary drum is employed to keep up a constant supply of rags to a revolving cutter cylinder operating against stationary knives, and consists in the employment of a conductor attached to the stationary knives for the purpose of regulating the supply of rags to the cutters.

Claim.—The employment of the conductor H, in combination with the rotary drum B, the rotary cutter cylinder D, and the stationary knives F, arranged substantially as and for the purpose specified.

No. 27,168.—NOAH SUTTON, of New York, N. Y.—*Improvement in Slide Valves.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the two pistons E E¹, and cylinders C C¹, between the two heads of the double D-valve, or what is equivalent, between two short connected D-valves, with a single steam passage in each of said cylinders, and an exhaust passage common to both of said cylinders communicating through the partition between the said cylinders with the main exhaust passage, substantially as described.

No. 27,169.—WILLIAM SWIFT, of Brooklyn, N. Y.—*Improved Invalid's Bedstead.*—Patent dated February 14, 1860.—On the top of the jointed mattress frame B rests a secondary frame D, which has attached to it strips *b* of suitable material extending across said frame, and placed at suitable distances apart. These strips are buttoned or looped to the side bars of the frame D in such a way that they may be readily attached or detached if found necessary.

The inventor says: I *claim*, first, the combination of movable frame D with mattress frame B, jointed pieces G, and weights F, all arranged and operating in the manner and for the purposes set forth.

Second. The frame B, when the same is pivoted to the head and foot rails, as and for the purposes described.

No. 27,170.—H. K. SYMMES, of Newton, Mass.—*Improvement in the Mode of Extinguishing Gas Lights.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The extinguishing of gas lights by means of an inverted cup B, or its equivalent, expanding chamber provided with an inlet valve *a b* so applied, substantially as herein described, in combination with the burner or supply pipe, that though it will be caused to effect the shutting off of the gas, by a temporary increase or diminution of pressure, it will not permit the renewal of the supply to the burners to be effected by a subsequent diminution or increase of the pressure.

No. 27,171.—B. T. TRIMMER, of Rochester, N. Y.—*Improvement in Grain Separators.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* inducting the grain to the screens *f m*, through the concentrated currents of two blasts by the small throats *a c* of division G, and *d* of division H, the blast through A, having an upward or convex, and that through *c*, a concave direction to the falling grain, substantially in the manner and for the purposes described.

I also claim the combination and arrangement of the perforated sheet metal screens having a section of larger orifices *f*, in communication with division G, and of smaller orifices *m*, with divisions H, of the chamber of separation above, substantially as and for the purposes described.

I further claim the arrangement and combination of the opposing segmental arms L, crank *o*, and spindles S S, with the screen box E, for giving the desired direction to the vibrations of the screens, and regulating the same substantially as set forth.

No. 27,172.—FRANCIS VAN DOREN, of Adrian, Mich.—*Improvement in Hand Seed Planters.*—Patent dated February 14, 1860.—The secondary hopper at the back of the seed box enables the operator, who carries the planter in his hand, to see whether seed is brought down from the seed box every time the planter is operated at a new hill.

The inventor says: I *claim*, first, the arrangement of a secondary hopper A at the front side and near the bottom of the planter for the seed which is brought from the main hopper by a roller connected to the plunger to fall into and thus be in sight of the operator until it is forced in the ground, substantially as and for the purposes set forth.

Second. The arrangement H *i j* for operating the device G, which scrapes the dirt off the discharge end of the planter, substantially as and for the purposes set forth.

No. 27,173.—E. L. VERTREES, of Howe's Valley, Ky.—*Improved Mode of Cutting Boot Vamps.*—Patent dated February 14, 1860.—This invention consists in cutting from the side of the foot and ankle, in lieu of the triangular opening, an opening pointed at each extremity, commencing with a point near the lower edge and extending upward to a point in or

near the ankle, and in drawing together the sides of this opening, so as to contract the leg at the ankle, and by the use of a single seam to produce a form of boot identical with that in general use.

Claim.—In combination with cutting a boot vamp without crimping, removing the pointed portion of the material M X N Y in the side of the ankle, and joining the edges so as to contract the back at O and incline the leg forward, substantially as, and so as to obtain the advantages, set forth.

No. 27,174.—JOSEPH VOWLES, of New Hudson, Mich.—*Improvement in Cultivators.*—Patent dated February 14, 1860.—This invention relates to a machine which can be used for cultivating the soil as well as for hoeing corn or any other plants set out in rows, the machine being made applicable for either purpose, and widened out, narrowed, raised, or lowered, and made to throw the soil from or to the plants in measures or regulated quantities, as may be desired.

The inventor says: I *claim*, in combination with the series of hoes or ploughs L L, the pair of front hoes or ploughs N N, constructed, arranged, and made adjustable in the manner and for the purposes herein described and represented.

I also claim the peculiar construction, combination, and arrangement of the frame, the pulleys, and the locking of the standards to the frame, substantially as described and for the purposes set forth.

No. 27,175.—EDWIN WARD, of New York, N. Y.—*Improved Churn.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The churn made up of a horizontal cylinder having ribs, as described, and an interior shaft armed with dashers, the cylinder being made to rotate in the one direction and the shaft and dashers in the opposite direction, as set forth.

No. 27,176.—EDWARD WEBSTER, of Hartford, Conn.—*Improvement in Gridirons.*—Patent dated February 14, 1860.—This invention consists of a revolving gridiron or meat broiler, in combination with a frame to fit the opening of a stove, or elsewhere.

Claim.—The folding and revolving broiler, in the manner as described, in combination with the frame and cover, substantially as described and for the purpose set forth.

No. 27,177.—W. R. WEBSTER, of Gowanda, N. Y.—*Improvement in Tanning.*—Patent dated February 14, 1860.—This invention consists of a solution of chloride of lime in which the hides are saturated, after the removal of the hair by the ordinary process, and the hides pass through the bait, and afterwards in a combining solution of the chloride of lime with the materials used in tanning. The tanning liquor is made of one hundred gallons of water, three pounds of chloride of lime, thirty pounds of gambier or catechu, six pounds of alum, and three pounds of salt.

Claim.—The use of chloride of lime in combination with the materials specified, or with any materials used in the ordinary process of tanning.

No. 27,178.—DECATUR WERST and AARON PUDERBAUGH, of Waltz Township, Ind.—*Improvement in Lathes for Turning Irregular Forms.*—Patent dated February 14, 1860.—This invention consists in the combination of the vertically reciprocating cutter, with the longitudinally travelling carriage and the laterally sliding gauge. The cutter is guided by a pattern, which revolves with the article operated upon.

Claim.—The combination of the vertically reciprocating cutters c with the longitudinally travelling carriage B and laterally sliding gauge E, by the means and in the manner substantially as described, for the purpose set forth.

No. 27,179.—CALVIN D. WHEELER, of New York, N. Y.—*Improvement in making Gauges for Sewing Machines.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a sliding rule, arranged as described, the spring point for the purpose of measuring and marking material for folding, to facilitate the operation of guiding said folds through a sewing machine for the successive stitches, as set forth and specified.

No. 27,180.—STEPHEN WILCOX, JR., of Westerly, R. I.—*Improvement in Hot Air Engines.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the dividing of the changing piston into two parts 1 2, and conducting the air through the space between them in its transfer from the cold to the hot end of the cylinder, substantially as and for the purpose set forth.

Second. Dividing the bearing X, or its equivalent, from the heated portion of the working

piston by the space Q, which space is in free communication with the external atmosphere, so that the heat is conveyed away by connection, substantially in the manner set forth.

Third. The arrangement of the exhaust valve T, hollow piston rod 3 and 4, and guide case 6, or their respective equivalents, for the purposes set forth.

Fourth. The combination and arrangement of the crank C Z, adjustable eccentric Y, and eccentric rod and connections, or their respective equivalents, for the purpose of working a valve, the seat of which is carried in or with the piston, substantially as set forth.

No. 27,181.—ABNER WILLSON, of Colden, N. Y.—*Improved Churn*.—Patent dated February 14, 1860.—A is the vessel for the cream; B the dasher; C the crank shaft; D the screw whirl; E the cord which passes over the screw whirl and operates it. This cord is attached either to the bow F or the treadles G; *a a* are the springs on the bow for keeping the cord properly tightened.

Claim.—The bow F, with springs *a*, when constructed as described, in combination with screw whirl D, operating as set forth and for the purposes described.

No. 27,182.—AUGUST WALZE, of St. Louis, Mo.—*Improvement in Smut Mills*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging and operating the cylinder D and beater B, with respect to each other as and in the manner described, not *per se*, but when the said cylinder is made with the opening S in one end (as at Fig. 5), and with its surface perforated with a flat punch upon diagonal lines, and when the said beater is made with the blades set diagonally across its axis in the manner described for the purpose specified.

No. 27,183.—CHARLES J. APPLETON, of Philadelphia, Pa., assignor to B. H. HOWELL, of New York city, and JOHN COTTON, of said Philadelphia.—*Improvement in Knitting Machines*.—Patent dated February 14, 1860.—This invention relates to an improvement in machines for knitting circular fabrics, and it consists in a system of hinged needles and sinkers combined with a thread guide, a wheel with a serrated edge, and a cam, or their equivalents, arranged and operated so as to produce a circular knitted fabric.

Claim.—The system of hinged needles and sinkers, in combination with the thread guide J, and the cam K, and serrated wheel I, or their equivalents, the whole being arranged and operating substantially as set forth.

No. 27,184.—GOTLIEB M. BARTH, of Philadelphia, Pa., assignor to himself and D. D. JONES, of said Philadelphia.—*Improvement in Weighing Carts*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, connecting the frame D, with its bars H and H¹, to the axle A, so as to be confined laterally and longitudinally to the said axle, and so that it may be elevated above the same, either perpendicularly or on one side more than the other, as and for the purpose set forth.

Second. The shaft E, with its projections or cams *i i*, and the projections *j j*, on the axle A, in combination with the frame D, the bars H and H¹, with sharp edged projections *n n*, and the body X of the cart, the whole being so arranged that, on turning the said shaft in one direction, the body of the cart will be supported solely by and on the said sharp edged projections, and on turning the shaft in a contrary direction, the body of the cart will be supported on the axles and the bars H and H¹, on the shaft E, as specified.

Third. The graduated lever M, connected with the bars H and H¹, by the arms J and K, and link *q*, in combination with the plate N, the latter being jointed to, and rendered adjustable on, one of the shafts C, and the whole being arranged substantially in the manner set forth.

Fourth. The shaft E, with its projections *w w*, in combination with the plates *u u*, on the underside of the body X, the whole being arranged as set forth for the purpose of retaining and releasing the said body.

No. 27,185.—ABNER BURBANK, of Brooklyn, N. Y., assignor to GEORGE W. BURBANK, of Rochester, N. Y.—*Improvement in Soldering Irons*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the soldering tool or iron with any suitable gas supply, when the arrangement is such that the soldering tool may be constantly supplied with gas, and the "copper" maintained in a heated state while the tool is used by the workman, substantially as shown and described.

Second. I claim the combination of a gas light with a soldering tool or iron to illuminate the interior and other parts of the work to which the tool may be applied, substantially as shown and described.

Third. The employment of a chamber *a*, in the base of the copper A, as and for the purposes shown and described.

Fourth. The employment of a tubular screw B, in combination with the copper A, and cylinder C, as and for the purposes shown and described.

No. 27,186.—THOMAS B. DE FOREST, of New York, N. Y., assignor to himself and WALLACE & SONS, of Ansonia, Conn.—*Improvement in Lanterns*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* forming, out of a vertical piece of wire, two of the vertical guard wires, substantially as set forth.

I also claim bending the double guard piece of wire *a*, into such shape as to form the connecting link for the attachment of the handle as specified.

I also claim forming the support for the protector C, out of one of the double guard wires, as shown and described, in combination with the retaining portion of the other extended wire, as set forth.

I also claim the peculiar construction of the handle D, as specified, for the purpose set forth.

No. 27,187.—JOHN R. HENSHAW, of Middletown, Conn., assignor to himself and SAMUEL BABCOCK.—*Improvement in Skates*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The plate *k*, made so as to be adjusted on the bars *f*, or its equivalent, and the thumb screw *h*, as means for securing the heel of the boot or shoe to the skate, as set forth.

No. 27,188.—WILLIAM H. JOHNSON, of Richmond, Ark., assignor to himself and J. D. BELLAH, of said Richmond.—*Improvement in Ploughs*.—Patent dated February 14, 1860.—The beam A is constructed of a draught block *a*, and a strip of iron *b* bent into a U form, the ends thereof lapping over the rear end of the block *a* notched to receive them. The two parts are united by the bolts *c c*.

The inventor says: I *claim* constructing the beam of the draught block *a*, and bent strip of iron *b*, arranged and combined as specified.

I also claim the ring D, in combination with the beam A, and share standard E, constructed, arranged, and operating substantially as specified.

No. 27,189.—JOSEPH LAMB, of New York, N. Y., assignor to himself and RICHARD LAMB, of said New York.—*Improvement in Portable Sleds*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a folding sled as a new article of manufacture, the parts being hinged together and capable of being instantly expanded into a rigid sled, or folded in a small compass, as set forth.

Second. I claim, in a folding sled, the described combination and arrangement of the grooved braces B, cross braces C, and runners R, whereby the sled, when folded, occupies a thickness equal only to that of the braces, B or C, themselves.

Third. I claim, in connection with the last, the described arrangement of the back frame A, by which it is folded into the plane of the braces B C, and runners R.

Fourth. I claim, in a folding sled constructed substantially as described the employment of the flexible or hinged foot rest E, so arranged and suspended as to secure the advantages set forth.

No. 27,190.—WILLIAM H. LAUBACH, of Philadelphia, Pa., assignor to himself and D. C. ENOS, of said Philadelphia.—*Improvement in use of Hydro-Carbon Vapor for Illumination*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forcing into and through the distributing pipes hydro-carbon vapor, at such a high temperature that no condensation of the vapor can take place in the said pipes, when the latter are so arranged that no closing of the burners can obstruct the free circulation of the heated vapor throughout every portion of the said distributing pipes, as and for the purpose set forth.

No. 27,191.—ISAAC P. LYKENS, of Pottsville, Pa., assignor to himself and WILLIAM BICKEL, of said Pottsville.—*Improvement in Machinery for Breaking Coal*.—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the reciprocating spiked plates I, and the spiked bars N, in combination with the chutes Q, and their movable doors *q*, the whole being arranged and operating substantially as set forth.

Second. Attaching both the upper and lower spikes, independently of each other, to the bars in such a manner that the position of the said spikes may be altered at pleasure, the bars themselves being likewise so secured as to admit of ready adjustment, in the manner and for the purpose specified.

Third. The springs M, arranged in respect to the spiked plate I, and the spiked bars N, as and for the purpose set forth.

No. 27,192.—DANIEL NICHOLSON, of Lockport, N. Y., assignor to himself and CHARLES R. Fox, of said Lockport.—*Improved Method of Feeding the Bolt to the Knife in Shingle Machines.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the racks R R, of two toothed longitudinal parts *v w*, so arranged as to be capable of adjustment one with the other, for the purpose of varying the taper of the shingles and sawing "stuff" of equal thickness throughout when desired.

Second. The arrangement of the racks R R, slides S T, connected by the lever U, and the slotted slides M N, operated by the lever O, and crank *g*¹, and fitted in the bar L, substantially as shown, for the purpose of actuating the racks R R.

No. 27,193.—ENOS B. PHILLIPS, of Cambridgeport, Mass., assignor to himself and CHARLES W. PHILLIPS, of said Cambridgeport.—*Improvement in the Manufacture of Skates.*—Patent dated February 14, 1860.—The runner A and the plate or top B of the skate on which the ball of the foot of the wearer rests, and also the heel plate C, are cast in one piece; the plate B and heel C being connected by a piece *a*, both being supported by the standards *b* rising from the runner.

The following composes the material of which the skate is cast: eight pounds of copper, one and a quarter pounds of tin, one and one-sixteenth pound of zinc, and one ounce of antimony.

Claim.—As a new article of manufacture, a skate cast from the described composition metal, substantially as set forth.

No. 27,194.—JAMES SPEAR, of Philadelphia, assignor to himself and D. C. ENOS, of said Philadelphia.—*Improved Post Office Stamp.*—Patent dated February 14, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing a stamp or die with letters, the outline of which is composed of fine points, constructed in the manner and for the purpose described.

Second. I claim stamping letters so that the letter, as well as the envelope, will bear the post office mark in a distinct manner, as described.

No. 27,195.—ROBERT ANDERSON, of Brooklyn, N. Y.—*Improvement in Machines for Hulling and Finishing Rice.*—Patent dated February 21, 1860.—The inventor says: My invention relates to the finishing of rice after the operation of hulling, and for this purpose I apply a rubbing operation that removes the refuse skin between the hull and rice. To perform this rubbing operation, I make use of a series of revolving beaters, or stirrers of alum dressed hide.

Claim.—A series of revolving beaters of alum dressed hide, acting to finish the rice, substantially in the manner specified.

No. 27,196.—S. R. ATKINS and J. R. HITCHCOCK, of Plantsville, Conn., assignors to J. R. HITCHCOCK, aforesaid.—*Improved Sausage Filler.*—Patent dated February 21, 1860.—This improvement consists in having a spring slide cut-off arranged over the nozzle, and nearly in line with the centre of the cylindrical case, so that as the meat is fed into the machine through the hopper the presser carries it around and presses it into the nozzle, and the spring cut-off working against the face of the presser cuts off the meat from travelling in a continuous and circuitous direction with the presser, which is forced by the action of the presser through the nozzle.

Claim.—A revolving presser *d*, within the case *a*, with the cut-off *i*, in the manner and for the purpose substantially as described.

No. 27,197.—FRANKLIN L. BAILEY, of Boston, Mass.—*Improvement in Printing Presses.*—Patent dated February 21, 1860.—This press operates as follows: A card having been placed upon the face of the platen D, against the guide *k*, motion is given to the press by crank 13, the platen is drawn upward, the nipper clasps the card in its upward motion towards the type, meanwhile the cam P receding allows the roller carriage to drop down, so that the roller F will rest against the ink cylinder just previous to the time that the platen reaches the form to take the impression. The upward movement of the platen being completed, it then falls back, the roller carriage again rises, the nipper lifts from the card, allowing it to drop, and the platen comes to a state of rest as before.

The inventor says: I *claim* giving to the vibrating platen its periods of rest and motion for the purpose described, when operated by the arms 11, 11, and shaft 1

Second. I claim the cavity *d*, and screw *b* for the purpose set forth.

Third. I claim the combination of the rack G and cam P, for the purpose set forth.

Fourth. I claim the combination of the guide k and vibrating platen D, for the purpose set forth.

No. 27,198.—EDWARD C. BETTS, of Huntsville, Ala.—*Improvement in Presses*.—Patent dated February 21, 1860.—This improvement consists in the use of rack bars, a lever provided with a movable fulcrum and pawls or hooks arranged and combined in a novel way for the purpose of giving the desired pressure; and it further consists in a peculiar arrangement of the press box in connection with the levers and rack bars aforesaid.

The inventor says: I claim, first, the combination of the rack bars F F and the lever G, when the latter is provided with the pawls I I, and the movable fulcrum rods H H, arranged to operate as and for the purpose set forth.

Second. The arrangement of the movable or sliding box B and follower rack bars F F, operated as shown, to admit of the exposure and consequent accessibility of the compressed article, for the purpose specified.

No. 27,199.—HENRY F. BOND, of Waltham, Mass.—*Improved Bread Slicer*.—Patent dated February 21, 1860.—This invention has for its object the production of a bread slicer by means of which a loaf of bread may be cut into pieces of various and uniform thicknesses, and consists in the use of a carriage on which the loaf is secured, and which is fed forward the requisite distance at each turn of the crank, and a rotary knife and eccentric gearing.

Claim.—The combination and arrangement of the eccentric gear wheels B and C, the knife G, the lever E, the carriage I, and the rack D, substantially as and for the purpose specified.

No. 27,200.—MAX BRAUN, of Brooklyn, N. Y.—*Improvement in Inkstands*.—Patent dated February 21, 1860.—This invention consists of a peculiarly constructed top for the ink cup, and the novel introduction of a small finger force pump for increasing the pressure of the air on the ink in the cup, and in this manner forcing it up into the fountain cup by supplying new air instead of densifying the air in the reservoir.

Claim.—The chamber E, with flexible perforated diaphragm e, hollow stem D, and tubes a b, combined with a fountain cup B, and arranged in the manner and operating upon the principles set forth.

No. 27,201.—HUGH B. BROWN, of Huntington, N. Y.—*Apparatus for Teaching Orthography, &c.*—Patent dated February 21, 1860.—This invention consists in the arrangement of blocks upon which letters or figures or words are printed, or otherwise represented upon axes in a frame, the arrangement being such that by turning the blocks upon their axes so as to present different faces, other words or figures or letters will be shown, and by changing the position of these blocks by rotation, various words and sentences may be expressed.

Claim.—The arrangement upon axes in a frame, as described, of a series of blocks with printed, or otherwise marked, and with blank sides, substantially as and for the purposes set forth.

No. 27,202.—WILLIAM A. CARPENTER, of Elgin, Ill.—*Improved Permutation Lock*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the employment of a bolt C, which is of a form approximating to a circle, and is arranged so as to be adjusted on a solid spindle C¹, which has an index e on its front end, in combination with the face plate of a safe door or a lock which has a circle or a part of a circle of figures or characters D marked on it, substantially as and for the purposes set forth.

Second. The combination of a series of bolts C of the form stated, having index spindles d C¹ e with a series of circles or parts of circles of figures or characters D on the face of the lock or safe door, substantially as and for the purposes set forth.

Third. The combination with the bolts C, having index spindles C¹ d e, of a turning shaft H, a wedge plate I, of the same shape circumferentially, at the bolts, a series of spring catches F F, a series of short levers G G, a series of stops I¹, and a series of indented plates E E, substantially as and for the purposes set forth.

No. 27,203.—THOMAS CASTOR, of Philadelphia, Pa.—*Improvement in Passenger Railway Cars*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the frame H, trussed and otherwise constructed, substantially as set forth, combined with and connected to the roof F of the car, and arranged on the same in respect to the opposite ends C and C¹ of the car, as and for the purpose set forth.

Second. I claim the detachable spiral ladder, composed of the pole I, its rounds m, and

connecting rib *n*, when the said ladder is arranged in respect to the platform B or B¹, and overhanging portions *e* or *e*¹ of the roof and connected to the same, substantially in the manner specified.

Third. I claim the guards P P, constructed and applied to the car, substantially as set forth, when the said guards are arranged to be controlled by the foot of the driver, through the medium of the vertical rods R and the levers Q Q¹, or their equivalents, as set forth, for the purpose specified.

No. 27,204.—GEORGE B. CLARKE, of Leonardsville, N. Y.—*Improvement in Ventilating Apparatus*.—Patent dated February 21, 1860.—This invention consists in combining a damper and an air valve with a twisted rod in such a manner that the expansion or contraction of the said rod, caused by the increasing or decreasing of temperature of the stovepipe, causes the damper to close or open an air valve.

Claim.—Combining with the damper *f* and an air valve *j*, or their equivalents, the slotted crossbar H, guide bracket *o*, and twisted rod or wire G, substantially in the manner and for the purposes specified.

No. 27,205.—EDWIN B. CLEMENT, of Barnet, Vt.—*Improved Churn*.—Patent dated February 21, 1860.—This invention consists in the application of a toggle-jointed lever at one end of a walking beam, to give motion to the dasher of a perpendicular dash churn.

Claim.—The arrangement of the toggle-joint F, walking beam E, crank H, and connecting shaft I, operating substantially as described and for the purpose set forth.

No. 27,206.—ARCHIBALD H. CROZIER, of Oswego, N. Y.—*Improved Machine for Cutting and Distancing Locks on Hoops*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim hinging the jaws which hold the hoop, so as to allow them to vibrate, or arranging them to traverse, and mounting them on a spring, substantially as described, so that may be moved to carry or feed the hoop to the cutter that cuts the lock or score; and in combination with the jaws for holding the hoop, I claim the cutter for cutting the lock.

I claim a yielding gauge, so constructed as to allow the operator to vary the length of the hoops somewhat in proportion to the thickness or crooks in the hoop worked.

No. 27,207.—S. S. CERTIS, of Croton Corners, N. Y.—*Improvement in Cooking Stoves*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Curving the fire-back K concentrically with the line described by the grate *g*, when vibrated or turned substantially as and for the purpose set forth.

No. 27,208.—JOB A. DAVIS, of New York, N. Y.—*Improvement in Sewing Machines*.—Patent dated February 21, 1860.—This invention consists in operating the shuttle driver and shuttle by means of or through a suspended lever, which is worked directly from and by the driving wheel of the machine, and connecting such lever with the shuttle bar by means of a flexible spring or joint.

Claim.—Connecting the lever B, having its fulcrum near to the power shaft, as set forth, with or to the driver C by the spring E, or flexible bar, as and for the purpose described.

No. 27,209.—SYLVESTER DENTON, of Penn Yan, N. Y.—*Improvement in Fences*.—Patent dated February 21, 1860.—A is the sill; it has a mortise in the centre; this mortise is made to receive the lower end of the upright B, also the post D; at the edge of the sill is a dove-tailed gain; this gain is made to receive the lower end of brace H.

Claim.—The sill A, upright B, post D, cleats F, and brace H, and the method of securing it, when constructed and arranged as specified and for the purposes set forth.

No. 27,210.—GEORGE W. DICKINSON, JR., of Breckenridge, Va.—*Improved Surveying Compass*.—Patent dated February 21, 1860.—The object of this invention is to arrange a surveyor's compass in such a manner that the same, by means of a series of adjustable scales, serves to solve all triangles and all rectilinear figures which may occur in the various operations of a surveyor.

Claim.—The arrangement of the scales *e f g* and *h* in combination with the main semi-circle C, and with the additional semi-circle F and protractor G, constructed and operating substantially as and for the purpose specified.

No. 27,211.—H. W. DOPP and WILLIAM S. MEAD, of Buffalo, N. Y.—*Improvement in Burners for Vapor Lamps*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the pipe A, wick tube c, and stop-cock *a*¹, by means of which the fluid is supplied to either or both of the pipes or tubes A and c; said cock being operated by means of a cam wheel D, substantially as and for the purpose specified.

Second. Arranging the burner G with the heater B, in the manner specified, the burner being secured to the heater, and the heater being provided with pins E which pass through the dark portion of the flame above the burner, substantially as specified.

Third. The arrangement of the burner G, heater B, pipe A, and tube c together, substantially in the manner and for the purpose specified.

No. 27,212.—ELIAKIM B. FORBUSH, of Buffalo, N. Y.—*Improvement in Apparatus for the Ventilation of Railroad Cars*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the revolving aprons A A¹, water and ice tank E, and stove K, (or other heating apparatus,) in a separate apartment or room within the car, relatively to the blower H, for the purposes described.

I claim the described arrangement of the distributing air pipes S S¹ and T, when arranged relatively to the described apparatus for purifying the air from dust, as set forth.

No. 27,213.—WILLIAM L. FORCE, of Keyport, N. J.—*Improvement in Oyster Dredges*.—Patent dated February 21, 1860.—This invention consists in supporting and hinging a peculiarly shaped rake, upon sled runners of sufficient width to prevent their sinking in the mud. and in arranging in a suitable manner upon the arms of the dredge a deflecting board, which is acted upon by the water so as to force the rake downward and keep it upon the bottom of the river.

The inventor says: I *claim*, first, the combination of the sled runners A A and deflecting board F, when the same are arranged in the manner and operate as set forth.

Second. I claim the flat-headed rake head in combination with the teeth *a a*, when said teeth are bent over the front edge of the head; all in the manner and for the purposes set forth.

No. 27,214.—JAMES E. A. GIBBS, of Mill Point, Va., assignor to J. O. Wood, of New York City.—*Improvement in Sewing Machines*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the mechanical production of the interlaced chain stitch in an organized sewing machine, by the combination, with the reciprocating eye-pointed needle and discoidal thread case or rotary hook and bobbin, or their equivalents, of the described automatic feeding mechanism to the cloth when so arranged in relation to, and operating in concert with, the said devices as to cause each loop taken from the needle to be carried by the hook through the preceding loop, substantially in the manner described.

Second. The combination and arrangement, substantially as described, of the eye-pointed needle, discoidal thread case, provided with two loop-taking hooks, with an automatic feed mechanism, operating in the manner set forth, so that a mere change in the direction of the feed shall effect the difference described between the several stitches.

No. 27,215.—JEREMIAH HEATH, of Providence, R. I.—*Improvement in Heel Screws for Skates*.—Patent dated February 21, 1860.—This invention consists in fixing in the centre of a suitable wheel, furnished with handles or holes punched in its periphery, a suitable screw which is capable of being rotated with the roller, and which, by turning said roller, will be forcibly driven into the heel of the boot, either before or after the skate is strapped to the foot.

Claim.—The wheel and screw, arranged and operating substantially in the manner and for the purposes set forth.

No. 27,216.—CHAUNCEY O. GREENE, of Troy, N. Y.—*Improvement in Cooking Stoves*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hollow cylindrical transversely-grooved grate bar, or grate bars N, when arranged lengthwise of, and so as to be capable of revolution within, the oblong fire box A, and having communication at one end with the open air, and at the other end communication with the smoke flues of the stove, by means of an air passage or air passages, arranged in contact with the outside of or leading through the part or parts of the oven not sufficiently heated by the fire box and smoke flues, substantially as and for the purposes set forth.

No. 27,217.—JOSEPH GRICE, of New York, N. Y., and ROBERT H. LONG, of Philadelphia, Pa.—*Improvement in Running Gear of City Railroad Cars*.—Patent dated February 21, 1860. The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the vibrating truck C, pivoted in advance of its axles in

the line of motion of the car, in combination with the arcs C^1 and C^2 , and friction rolls K, with suitable bearing surfaces in the bottom of the car body; the whole constructed and operating substantially as specified for the purpose set forth.

And we also claim, in combination with a vibrating truck pivoted at a point not over the axles, the employment of sustaining arcs, so arranged on each side of the axles as to support the car and relieve the turning point of all weight, as specified.

No. 27,218.—THOMAS HANSON, of New York, N. Y.—*Improvement in Apparatus for Supplying Water to Buildings*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim combining the engine which is operated by the head of water with the pump, forcing water to the upper part of the building by means of a lever, with a shifting adjustable fulcrum, substantially as and for the purpose specified.

I also claim the arrangement, substantially as described, of the engine and pump, so that the connecting lever can be removed, and a hand lever substituted, as described, that the pump may be operated by hand when, from any cause, the pump cannot be operated by the engine.

I also claim the split packing rings and plates secured thereto, substantially as described, in combination with the conical boss on the piston rod, substantially as described, to render the piston self-packing by the pressure of the fluid.

No. 27,219.—SAMUEL H. GILMAN, of New Orleans, La.—*Improvement in Apparatus for Evaporating Saccharine Juices*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, in the construction of pans or kettles for evaporating saccharine juices or other liquids, making the bottoms thereof of a series of vertical compartments, open at the upper edge to receive the liquid from the upper part of the pan or kettle, and closed at the bottom, except for the purpose of connecting the inside of the series, and with open spaces between every two of the series forming continuous passages open to the flue space, except where obstructed by the connecting pipes for the action of the products of combustion, substantially as and for the purpose specified.

I also claim making each of the said compartments of the series constituting the bottom of a pan or kettle, separate from the others and from the upper part of the pan or kettle, and provided with flanches to connect it with the series and with the lower edge of the upper part of the pan or kettle, substantially as and for the purpose specified.

I also claim increasing the heating surface of each pan or kettle of a train relatively to its liquid cubical contents, in the ratio of its greater distance from the furnace, by making the series of compartments constituting the bottom thereof, substantially as described, of greater depths each in succession as they are more distant from the furnace, for the purpose described.

I also claim the manner, substantially as described, of connecting the series of pans or kettles constituting the train by means of the flaring sides, substantially as described, in combination with the manner of connecting the bottoms therewith, substantially as described, and for the purpose specified.

And, finally, I claim the vibrating dipper, connected and combined with the pans or kettles, substantially as described, for the purpose of transferring the liquid from one pan to the next in the train, as set forth.

No. 27,220.—GEORGE E. HOYT, of Brooklyn, N. Y.—*Improvement in Machinery for Breaking Coal*.—Patent dated February 21, 1860.—This invention consists in the use of a plunger armed with teeth, and placed over an intermittingly rotating or a rectilineally reciprocating screw, which serves as a bed for the toothed plunger, the above parts being also used in connection with a gauge and rake.

Claim.—In connection with the plunger and screen, the gauge M and rake H, arranged substantially as and for the purpose described.

No. 27,221.—CHARLES W. HUBBARD, of Pittsburgh, Pa.—*Improved Machine for Polishing and Grinding Saws*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of an adjustable friction roller, set in a swinging frame, and pressed up by springs, in combination with another friction roller on a permanent revolving axis, for the purpose of revolving the saw at a uniform speed differing from that of the grindstone, independently of the motion of the stone, and unaffected by it, thus preventing the tendency of the stone to affect the revolutions of the saw.

No. 27,222.—ENOCH JACOBS, of Cincinnati, Ohio.—*Improvement in Joining Plates of Metal*.—Patent dated February 21, 1860.—A represents the plates to be united, and B the splice plate;

B the form of the splice plate when rolled into its proper shape; *c c* represent the form best adapted for the rivets to fasten the plates together.

Claim.—The construction of the joint, made by means of the closely abutting plates *A A*, and the flat and semi-cylindrical plate *b b*¹ and rivets *c c*¹, substantially in the manner and for the purposes set forth.

No. 27,223.—DANIEL JONES, of Boston, Mass.—*Improved Steering Apparatus*.—Patent dated February 21, 1860.—The object of this improvement is to secure a direct thwartship action of a screw upon the tiller, and at the same time to leave the tiller in a condition to be readily operated by block and tackle in case of an accidental derangement of the steering apparatus.

The inventor says: I *claim* the direct application of the power of the traversing screw *H* to the tiller *C* or the yoke tiller *L*, in the manner described, when the steering wheel operates the screw *H* by single gear, and is placed on the middle line of the ship, as specified and shown.

I also claim, in combination with the above arrangement, the cam yoke tiller *L*, constructed and operated substantially as described.

No. 27,224.—GILBERT DANIEL JONES, of New York, N. Y.—*Improvement in Mills*.—Patent dated February 21, 1860.—This invention consists in forming the bottom or grinding surfaces of runners conical, in the form of an inverted cone, and in forming the bed with corresponding conical surfaces.

Claim.—Constructing the bottom or grinding surfaces of the runners conical, in the form of an inverted cone, and the bed in and around which they revolve, with corresponding conical surfaces, substantially in the manner described.

No. 27,225.—W. J. JOHNSON, of Newton Corner, Mass.—*Improved Dish Cloth Holder*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described dish cloth holder, constructed with round or square jaws or tines, and bent or curved in such a manner that the cloth will be suitably retained by the same and held in a closed state by a metal slide, or its equivalent, forming a new article of manufacture.

No. 27,226.—FERDINAND C. LIGHTE, of New York, N. Y.—*Improvement in Grand Piano Fortes*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the iron frame with two plate-like portions *A B*, one elevated above the other, and with an opening *a b* between them for the turning pins of the wrest plank, and constructing the wrest plank with a step *h* and fitting it to the bottom of said parts, *A B*, of the frame, all substantially as described.

No. 27,227.—JOHN LIPPINCOTT, of Pittsburgh, Pa.—*Improvement in the Manufacture of Axes*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making axes with a head of cast iron, cast into and around a steel bit and afterwards finished and dressed, as hereinbefore described, as a new article of manufacture.

No. 27,228.—JAMES W. LYON, of Brooklyn, N. Y.—*Improved Machine for forming Guard or Gas Cocks*.—Patent dated February 21, 1860.—This invention consists chiefly in the peculiar arrangement of the stationary taper mandrel *L*, with relation to the position of the cutter when in action, so that the barrels can be rapidly and successively placed on the mandrel and removed by the operator without removing the mandrel, and at the same time placing the portion necessary to be removed is properly presented to the action of the cutter.

The inventor says: I *claim* the combination of the taper mandrel *L* with the rotating cutter *H*, substantially in the manner and for the purposes herein described. The arrangement of the adjustable gauge *Q* with relation to the mandrel *L*, substantially as described.

No. 27,229.—A. G. MACK, of Rochester, N. Y.—*Improvement in Last Holders*.—Patent dated February 21, 1860.—This invention consists of a movable standard having attached to it a spring rod the upper end of which is inserted in the last, an upright standard with a sliding rest for the toe of the last, and an eccentric by which the sliding rest is raised or lowered.

Claim.—The arrangement of the movable standard *M* and spring rod *r*, with the upright standard *B*, sliding rest *D*, and eccentric *E*, as and for the purposes set forth.

No. 27,230.—WILLIAM S. MEAD and H. W. DOPP, of Buffalo, N. Y.—*Improved Ventilating Valve for the Delivery of Liquids*.—Patent dated February 21, 1860.—This invention consists in the employment of an elastic diaphragm, provided with a shut-off ventilating tube, in combination with an air chamber, within which said diaphragm is so arranged that it will be raised or lowered, to open and shut off the ventilation by either the atmospheric pressure without or the pressure from gaseous liquids within.

Claim.—The employment of an elastic diaphragm B, provided with a ventilating tube C, in combination with an air chamber A, the whole being arranged and constructed substantially in the manner and for the purpose set forth.

No. 27,231.—RENSSELAER MERRILL, of Elmira, N. Y.—*Improved Clothes Dryer*.—Patent dated February 21, 1860.—This invention relates to a portable, self tightening, self securing, revolving clothes reel, for the purpose of drying clothes.

Claim.—The combination of the collar C, cap A, and braces D and E, with the radial arms B, when constructed and arranged in the manner and for the purpose set forth.

No. 27,232.—JOHN S. MITCHELL, of South Boston, Mass.—*Improvement in Spring Skates*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An improved skate, having its foot rest A constructed not only with sockets *a a* for the reception of helical springs *b b*, for supporting the foot rest on the runner B, but with separate sockets *c c*, and lateral passages *d d*, arranged with reference to the springs *b b*, substantially in the manner, and to receive tenons and holding pins or stops connected with the runner, as described.

No. 27,233.—ELIAS PARISH and WATSON PARISH, JR., of Galesburgh, Ill.—*Improvement in Mole Ploughs*.—Patent dated February 21, 1860.—A is the mole or plough, having a groove H running from the point up and back to the coulter C upon a sliding piece B, which is hinged to the coulter C, as shown at B¹; another groove G is also formed near the bottom of the mole, commencing at the point and running back on each side to the rear of the plough.

The inventors say: We *claim*, first, the combination of the grooved hinged piece B with the coulter C and mole part A, arranged and operating substantially as set forth.

Second. The combination of the hinged plane E, roll F, hinged bearings *h h*, and scrapers *f f*, with the rear end of the draft beam D, substantially as set forth.

No. 27,234.—JOHAN F. C. PEIKHARDT, of New York, N. Y.—*Improved Sofa Bedstead*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the cushions K L M, as shown and described, to wit: the cushions L M, connected by hinges *f*, cushion L being attached to the bars I by means of the hooks *g g* fitting in the slots *h h* thereof, and the cushion M attached to the posts A A by means of journals *j* fitting in either of two pairs of grooves or recesses *k l*, while the cushion K is connected to the bars I by hooks *n* fitting in the slots *h*, substantially as and for the purpose set forth.

Second. In combination with the cushions K L M, the adjustable and folding side pieces O O, arranged as shown, to form sides for the article when used as a bedstead, and be capable of being folded compactly against the side rails D when the article is used as a sofa.

No. 27,235.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Horse Powers*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the loose cap C with the hub E of the wheel D and the ends of the bars B, and also bracing the said bars from the said cap C by means of chains *e e e*, for the purpose of taking the stress off of the rim of the wheel D and concentrating it in the said cap, and also the combination of the spider bracket *b* with the loose cap C and the centre pin and the hub E, for the purpose of securing the ends of the bars B, substantially as described.

No. 27,236.—THADDEUS S. SCOVILLE, of New York, N. Y.—*Improved Mosquito Bar*.—Patent dated February 21, 1860.—To the tops *a a* of the head posts, or other convenient parts of the bedstead, are secured the vertical supporting rods *b b*, and on these rods respectively are situated the adjustable supporting blocks *g g*, which are secured at any desired point on the rods by means of set screws *h h*; on these supporting blocks rest the hinges *f f*, arranged so as to turn horizontally on the rods *b b* and vertically on the joints *m m*.

Claim.—The combination and arrangement of the supporting posts *p p*, adjustable doubly-turning hinges *f f*, curtain frame *c d*, cords *i i*, pulleys *k k*, and balance weight *l*, substantially in the manner and for the purpose specified.

No. 27,237.—THOMAS S. SMITH, of Cincinnati, Ohio.—*Improvement in Floors of Malt Kilns.*—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the perforated plate A, the tessellated frame work C B, the upper edges of which are rounded as described, the whole being arranged in the manner as set forth, for the purpose of enabling the heated air to pass equally upward through the perforated plate, there being no obstructing surface under the said perforated plate.

No. 27,238.—ABRAHAM REESE, of Pittsburgh, Pa.—*Improved Rivet and Bolt Machine.*—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of a sliding die carriage working upon rollers, in the manner described.

Second. The combination of a heading tool, reacting by means of a spring with a trip hammer, so arranged as to give repeated strokes on the heading tool between each stroke of the gripping dies and with dies forming a matrix for the head of the bolt or rivet, for the purpose of forging the heads of bolts and rivets into shape, when inclosed in a die, by repeated blows of the hammer on the heading tool working in the cavity of the heading dies, in the manner hereinbefore described.

No. 27,239.—P. H. ROOTS, of Connersville, N. Y.—*Improvement in Water Wheels.*—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The recesses *f* and the pistons C, of described configuration, so as to insure requisite strength, in combination with the cylinders A D, so as to prevent the retardation of the piston by the water as the pistons enter and leave the recesses, substantially as and for the purposes set forth.

No. 27,240.—AUGUSTUS PRUYN, of Albany, N. Y.—*Improved Device for Allowing for Contraction or Expansion of Buck Saw Blades.*—Patent dated February 21, 1860.—This invention relates to an improvement in that class of handsaws which are formed of thin narrow steel plates or strips, strained in frames, such as those for sawing fire wood, and also those used by joiners for sawing scroll or curved stuff.

Claim.—The combination with the saw blade and saw frame of a spring *c*, when the said spring is placed within a slotted opening in the blade and covered by the frame, as and for the purpose shown and described.

No. 27,241.—AUGUST SEMMENDINGER, of New York, N. Y.—*Improvement in Photographic Cameras.*—Patent dated February 21, 1860.—This invention consists in combining a spring board with the usual photographic apparatus, for the purpose of facilitating the sliding operation of the glass holder or other holder on which the picture is to be taken, and also in providing the said glass holder with double grooves and the light-diminishing board with double tongues.

The inventor says: I *claim* the spring board A in combination with a photographic apparatus, in the manner and for the purpose substantially as described.

Also the double grooves *e*¹ and *n*¹ and the double tongues *e* and *n*, in combination with the glass holder B, substantially in the manner and for the purpose set forth.

No. 27,242.—GEORGE W. RAMSEY, of New York, N. Y.—*Improvement in Steam Ploughs.*—Patent dated February 21, 1860.—The swing frame F extends forward to the front end A, and also extends back a sufficient distance to receive the fixed shaft I, which forms a part of the said frame, and upon which the two plough cylinders J J with spiral cutting blades are held in proper position and made to revolve by the endless chain *k* working upon the chain wheels L on the outer ends of the two cylinders and also upon the outer sides of the travelling wheels B.

Claim.—The arrangement of the plough cylinders J J, driving wheels, guide wheel, boiler, and engines; the whole being constructed, operated, and operating as shown and described.

No. 27,243.—ALVA M. SOUTHWORTH, of Dorchester, Mass.—*Improved Attachment for Sail Cringles.*—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the broad metallic plate secured to the yard, and having formed on it a flange or shoulder, and the sliding hook engaging with the said flange or shoulder and the head cringle of the sail, as described.

No. 27,244.—TIMOTHY SULLIVAN, of New York, N. Y.—*Improved Tool for Cutting and Pulling Thread*.—Patent dated February 21, 1860.—This invention consists of a knife-like blade A bent downwards so as to form an inclined plane, and to allow its points to catch more readily under the thread. The point B is rounded so as to form a finger-like prong, and it is bent so that it is parallel with the handle C. The blade A terminates in a shoulder *a*, which prevents the thread slipping beyond the cutting edge.

The inventor says: I *claim*, first, the combination of the blade A with the finger-like prong B, or its equivalent, substantially in the manner and for the purpose specified.

Second. The arrangement of the spring jaw D in combination with the blade A and prong B, constructed and operating substantially as and for the purpose described.

No. 27,245.—BENEDICT SWAIN, of Washington, D. C.—*Improvement in Projectiles for Fire Arms*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of a flat spiral tail with a conical tail so constructed as to form a shoulder for the wooden packings to rest against, thereby causing the head of the shell to receive the full force of the discharge of the gun; at the same time I secure the wooden packings at the extreme end by the use of a metal sabot, which sabot also protects the composition which is pressed into the hollow shaft in the tail, intended for a rocket or to fuze the head of the shell.

No. 27,246.—AARON W. SWEET, of Cincinnati, Ohio.—*Improvement in Conical Grinding Mills*.—Patent dated February 21, 1860.—This invention relates to the construction of the cone and concave of a conical grinding mill, by which the grain is automatically fed to the mill with such regularity as to dispense with the use of an adjustable hopper, or such other devices by which a regular and gradual feed of the grain is effected in conical mills.

Claim.—In combination with the conical cracking and grinding surfaces on the burr and concave, the feeding cone and its concave, constructed and arranged substantially as described.

No. 27,247.—H. R. TAYLOR, of Roxbury, Mass.—*Improvement in Supporting Furniture Drawers*.—Patent dated February 21, 1860.—This invention consists of a device for bringing out the slides B with the draw at the first part of its movement, and when brought out as far as they are intended to move, releasing the draw to let it continue its movements without the slides.

Claim.—Bringing out the slides B, with the first part of the movement of the drawer, substantially as set forth.

No. 27,248.—CHARLES VAN BONHORST, of Hancock, Md.—*Improvement in Lamps*.—Patent dated February 21, 1860.—This lamp has two wick tubes with an air space between and around the tubes and draft passages; the flames of the two wicks mingle together, and the smoke between and around the bases of the flames is supplied with oxygen.

Claim.—The combination of the air space *c*¹, air space B, draft passage *c*, and draft passage *a*, in the manner and for the purpose described.

No. 27,249.—A. A. WASHBURN, of St. Johnsville, N. Y.—*Improved Washing Machine*.—Patent dated February 21, 1860.—This invention relates to certain improvements in that class of washing machines in which a concave swinging tub and a stationary washboard, together with two pounders, are employed. The fluted rollers in the washboard and a corrugated bottom, together with the peculiar shape of the pounders, facilitate the washing.

Claim.—The arrangement of the fluted rollers E, in the stationary washboard D, and combination with the corrugated bottom of the tub and with the concaves *i*, in the pounders F, substantially as and for the purpose specified.

No. 27,250.—JOHN W. WHEELER, of Cleveland, Ohio.—*Improvement in Grain Mills*.—Patent dated February 21, 1860.—This invention relates first to certain peculiarities in the dress, and second to an improvement in the means of feeding the mill.

The inventor says: I *claim*, first, the stationary adjustable hopper C, in combination with plate Z, for regulating the feed of the grain to the cones.

Second. I claim the recess or grooves *d*¹ between the dress rings, whether in connection or not with extending a few of the teeth or ridges *e*¹ of the dress across the recesses or grooves, as and for the purposes set forth.

No. 27,251.—ANDREW WILLMANN, New York, N. Y.—*Improvement in Compositions Formed of Caoutchouc*.—Patent dated February 21, 1860.—The claim explains the nature of the invention.

Claim.—The combination with the rubber or its compounds of coke, or its equivalent,

when reduced to a finely divided state, together with the anhydrous alkaline salts mentioned, and whether the latter be used separately or in combination, substantially in the manner and for the purposes set forth.

No. 27,252.—CHARLES B. WITHINGTON, of Rock, Wis.—*Improvement in Harvesters*.—Patent dated February 21, 1860.—This invention relates to an improvement in the raking apparatus and the manner of discharging the cut grain from the platform; *a* is a pulley upon the main supporting shaft, on the inside of the main supporting wheel; *c* is a belt which encircles the said pulley and connects it with the pulley *a*¹ on the shaft *d*.

Claim.—The combination of the spring *W*, connecting rod *V*, shaft *i*, sliding rake head *L*¹, guide *q*, loose pulley *f*, ratchet wheel *j*, spring *g*, and catch *h*, when these several parts are arranged in relation to each other and to the main frame and platform in the manner described, for the purposes specified.

No. 27,253.—A. H. WOOD, of Boston, Mass.—*Improved Engraver's Vise*.—Patent dated February 21, 1860.—The object of this invention is to produce such a holding and bearing surface during the process of engraving, and other analogous purposes, as not only to firmly grasp the outside to be engraved or operated upon, but also to allow the said apparatus to yield in some degree, so that the work, however irregular in its shape and varying in its thickness, shall be firmly held.

Claim.—The combination of a proper spring and the tilting frame *c c*, operating together in a suitable stock or standard, as described and for the purpose specified.

No. 27,254.—CHARLES WRAY, of San Francisco, Cal.—*Improvement in Furnaces for Plating Iron*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* combining with the crucible and the means of applying heat thereto, the employment of a muzzle or roof to the crucible, leaving a narrow opening on opposite sides for introducing the sheets of iron or other articles to be plated, and for drawing them out of the molten metal, substantially as and for the purpose specified.

And I also claim, in combination with the crucible covered with a muzzle or roof and heated in the manner described, the placing of the fire door or doors above the muzzle or roof, substantially as and for the purpose specified.

I also claim, in combination with the crucible covered with a muzzle or roof and heated, as described, making the openings through the outer shell of the furnace inclining upward and outward from the opening in the crucible, through which the articles being plated are drawn out of the crucible, substantially as and for the purpose specified.

And I also claim, in combination with the crucible and the surrounding fire chamber, constructing the side walls of the surrounding masonry with an opening in area equal to the sectional capacity of the internal chamber which contains the crucible, and closing such opening with movable sections, substantially as and for the purpose specified.

No. 27,255.—JONES YERKES, of Philadelphia, Pa.—*Improved Refrigerator*.—Patent dated February 21, 1860.—This invention consists of a refrigerator having four compartments, (each having an inlet and exit opening,) an ice chamber, and a cold air chamber with a partition, the whole of the parts being arranged in respect to each other and to an air space in the outer casing, so that the whole of the chambers may be thoroughly and equally refrigerated.

Claim.—The upper chambers *G* and *G*¹, with their respective openings *b* and *c*, the lower chambers *H* and *H*¹, with their respective openings *d* and *e*, the ice chamber *I*, and the cold air chamber *J*, with its partition *h*, the whole of the above mentioned parts being arranged in respect to each other and to the air chamber *C*, as and for the purpose set forth.

No. 27,256.—N. B. CLEVELAND, of Waupun, Wis., assignor to LYMAN UPDIKE and J. M. HOSNER, of said Waupun.—*Improved Submerging Barrel Head*.—Patent dated February 21, 1860.—The invention consists in providing a movable barrel head with adjustable arms on its back.

Claim.—The employment of the head *A*, provided with the movable arms *B B*, when the same is used substantially as and for the purpose specified.

No. 27,257.—JOHN M. JONES, of New Orleans, La., assignor to himself and H. O. AMES, of said New Orleans.—*Improvement in Skimmers of Sugar Juices*.—Patent dated February 21, 1860.—This invention consists in furnishing the skimmer with a float, which, resting on the syrup, will support it during the skimming operation; and also arranging it so that any syrup taken up with the skimmings drains back into the kettle or pan.

Claim.—As an improved article of manufacture, a skimmer for sugar and other substances, composed of a metallic bowl *A* and an air chamber or float *D*, constructed and combined substantially as shown and described.

No. 27,258.—DANIEL B. NEAL and H. C. EMERY, of Mount Gilead, Ohio, assignors to themselves and GEORGE E. HOUSE, of said Mount Gilead.—*Improvement in Apparatus for Evaporating Saccharine Juices*.—Patent dated February 21, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the employment in the furnace A of two flues, in combination with a central cooling air chamber under the pan, the flues being divided from each other by means of a wall B, and which are provided each with a series of dampers C C¹, substantially as and for the purpose specified.

Second. Providing the bottom of the pan with two flanges, which fit snugly against the sides of the wall B, the flanges, the wall, and the bottom of the pan forming the four sides of an air chamber under the pan, substantially as and for the purpose specified.

No. 27,259.—CHARLES L. ROBINSON, of Waukesha, Wis., assignor to THOMAS G. EGGLESTON, of Fox Lake, Wis.—*Improvement in Tanning*.—Patent dated February 21, 1860.—This invention consists in the employment in combination with terra japonica, which has been purified by sulphuric acid, of carbonate, sulphate or calcined magnesia, and sulphate of potassa, for the purpose of tanning skins and hides of all descriptions.

Claim.—The employment, as and for the purposes specified, in combination with the purified terra japonica liquor described, of carbonate, sulphate or calcined magnesia, and sulphate of potassa in about the proportions set forth.

No. 27,260.—JAMES ROWE, of Cincinnati, Ohio, assignor to himself and MARTIN B. EWING, of said Cincinnati.—*Improvement in Sewing Machines*.—Patent dated February 21, 1860.—This invention relates to the employment of a looper. The looper T is in its construction similar to a needle furnished with two eyes near its point, and a little removed from each other, the looper being curved a little between the two eyes, so that the curve back of the eye nearest the point shall furnish an opening for the needle in its downward passage between the looper and its thread, through which to carry its own loop.

The inventor says: In combination with a needle of a sewing machine, I *claim* the double-eyed curved looper T as constructed, the same being made to operate in the manner substantially as set forth for the purpose described.

No. 27,261.—ELISHA M. SMITH, of Indianapolis, Ind., assignor to himself and ELERIDGE G. MAYHEW, of Shelbyville, Ind.—*Improvement in Moulding Machines*.—Patent dated February 21, 1860.—This invention consists in providing adjustable patterns, and so attaching them to any common sash planing machine as to convert said sash into a circular moulding or circular sash machine.

Claim.—The combination of variable guides and their necessary appendages with a sash or moulding machine, substantially as described in the specification.

No. 27,262.—GEORGE ELLIOTT and GEORGE F. ELLIOTT, of Manchester, Conn.—*Improvement in Locks*.—Patent dated February 21, 1860.—This lock has a series of circular hook plates, so arranged in a case that, in order to unlock it, it is first necessary to disconnect said plates by certain peculiar movements of the key.

The inventors say: We *claim*, first, the combination of the hook plates B B¹, spring pivot h h¹, and inclined slotted eccentric rim F, the whole constructed, arranged, and operating substantially as and for the purpose described.

Second. The movable tumbler E, in combination with the hook plates B B¹, spring pins h h, and eccentric rim F, substantially as and for the purpose described.

No. 27,263.—DANIEL BACH and KASIMIR KRENKLE, of New York, N. Y.—*Improved Folding Bedstead*.—Patent dated February 28, 1860.—When the bed is unfolded and put up for use, the end of the rail B pushes the catch C away until said end comes into the recess of the catch, when the latter falls by its own weight and embraces the end of the rail, and holds the same firm in its place.

Claim.—The application and use of a self-acting catch C to secure and hold the side rail B in the proper place when the bedstead is put up for use, in the manner substantially as described.

No. 27,264.—JOSEPH BISSINGER, of New York, N. Y.—*Improved Bracelet Fastening*.—Patent dated February 28, 1860.—This invention consists in combining a screw with the usual spring latch or catch of the bracelet, for the purpose of locking the said bracelet after being closed, in such a manner that a pressure on the spring or latch will cause an opening of the same.

Claim.—The screw e, in combination with the spring latch or catch n, for the purpose of preventing an accidental opening of the bracelet or necklace, in the manner substantially as described.

No. 27,265.—G. M. BLIGH, of New York, N. Y.—*Improvement in Paint Cans*.—Patent dated February 28, 1860.—The object of this invention is to provide a simple and efficient device for fastening down the covers of cans for putting up paints and other substances, which device allows, at the same time, the opening of said can without the aid of the soldering iron, and without injury to any part of the can.

Claim.—The employment, in combination with the can A, of the swivel catches E, when constructed and arranged as set forth, for the purpose specified.

No. 27,266.—HENRY F. BOND, of Waltham, Mass.—*Reading Card*.—Patent dated February 28, 1860.—The nipper C is made to hold by its power as a spring upon the back or side of the book cover; the long arm of the hook B is thrust in between the leaves, the other arm, to which the cord D is attached, hanging over the open page.

Claim.—The combination of the card, the elastic cord, and the paper knife, for the purposes and substantially after the manner above described.

No. 27,267.—JOHN BRYNER, of Peoria, Ill.—*Improved Counting House Calendar*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An arrangement of figures, pins, knobs, or other fastenings (for memoranda) on a board or other material, together with cases for movable names of the months, divided into spaces in which to place any required memorandum or appointment under its proper date, for the purpose of facilitating business men and others in keeping any and all appointments or business of any description to be attended to at any given time.

No. 27,268.—JOSEPH M. BUTLER, of Oxford, Miss.—*Improved Implement for Boring Wells*.—Patent dated February 28, 1860.—The auger *a* is operated within the case *b*; *e* is a valve which opens upwards and closes upon the whole width of the auger thread at a little distance above its cutting edge *c*. When the auger is drawn up, the weight of the sand closes the valve, and it is retained.

The inventor says: I *claim*, first, the employment of wire rope for operating the auger, as set forth.

Second. I also claim making the shaft of the auger hollow, as set forth.

No. 27,269.—WILLIAM CAMPBELL, of Jersey City, N. J.—*Improved Photographic Plate Shield*.—Patent dated February 28, 1860.—This invention consists in providing the photographic camera shield with a revolving plate frame and a slide with one or more small apertures, so that by revolving the plate different parts of the same are successively brought before the apertures of the slide.

Claim.—The revolving plate frame C, substantially in the manner and for the purposes set forth.

No. 27,270.—J. THEODORE CHABOT, of Buffalo, N. Y.—*Improved Steering Apparatus*.—Patent dated February 28, 1860.—By turning the steering wheel C right and left, the screw M is made to revolve correspondingly by its connection with the chains K and L, encompassing the wheels F G H and N, the screw M also moving horizontally, also moving the tiller S right and left, or the tiller Q.

Claim.—The combination and arrangement of the steering wheel F, chain wheels F G H N, double thread screw M, endless chains K L, and screw swivels *v v*, and as connected to tiller, substantially for the purpose specified.

No. 27,271.—JOSEPH CODLING, JR., and JOHN MCCUNIFF, of Fairbanks, Iowa.—*Improvement in Feed Water Heaters for Steam Boilers*.—Patent dated February 28, 1860.—This invention consists in the employment, in combination with hollow bars, of copper tubes passing longitudinally through the said bars, and connecting with transversely arranged cylinders or boxes, which are arranged below them at each end, and provided with connections to the feed pump and tank.

Claim.—The employment, in combination with hollow grate bars, of a system of tubes B B, and cylinders or boxes C C, on connecting pipes D D¹, the whole arranged substantially as specified.

No. 27,272.—LEWIS T. CONOVER, of Philadelphia, Pa.—*Improvement in Vapor Lamps*.—Patent dated February 28, 1860.—This invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the vertical sediment tube and its cup, as arranged in relation to the conducting tube and reservoir and valve, as set forth.

Second. I claim the vaporizing chamber in the horizontal conducting tube, as it is connected with the heating head *n*, having its wicked extension in the conducting tube, and as it is arranged in relation to the feeding tube and burner, as described.

No. 27,273.—GEORGE COPELAND, of Gray, Maine.—*Improvement in Seeding Machines.*—Patent dated February 28, 1860.—This invention consists in the employment or use of a feeding screw D, placed within a suitable hopper A, and used in connection with a rotary throwing device F attached to the seed box.

The inventor says: I *claim*, first, the distributing fan or throwing device F, when constructed in the peculiar form shown and described.

Second. The arrangement and combination of the throwing device F, hopper or seed box A, bag B, and screw D, as and for the purposes shown and described.

No. 27,274.—L. B. CORBIN, of Dryden, N. Y.—*Improvement in Grain Separators.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* making the spreading aprons adjustable, so that the degree of inclination of each and any of them may be varied at pleasure, for the purposes before set forth.

I also claim the adjustable frontispiece H of the spreading chamber, in combination with the partition K, the whole arranged to operate as specified, for the purposes set forth.

No. 27,275.—W. G. CRUTCHFIELD, of Dayton, Ohio.—*Improvement in Operating Governor Valves for Steam Engines.*—Patent dated February 28, 1860.—This invention consists in the employment of a cam cylinder H, and traversing lever I, for the purpose of adjusting the valve and regulating the quantity of steam.

Claim.—The arrangement of the sleeves E and F, pinion G, screw shaft K, tubular arm O, lever I, wheels s and x, and cam cylinder H, when the same are used substantially as and for the purpose specified.

No. 27,276.—A. W. CUNNINGHAM, of West Middleton, Pa.—*Improved Churn.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the spring dasher, worked by a cam and constructed as described, of longitudinal strips e e e, so set as to present their angular edge to the cream as they strike it, with a box deeper at one end than at the other, to accommodate the stroke of the dasher.

No. 27,277.—JOHN G. DODGE, of St. Louis, Mo.—*Improved Tent Frame.*—Patent dated February 28, 1860.—This invention will be understood by the claim and engravings.

Claim.—Combining the legs e¹ c c c with the beam B, not *per se*, but when the said legs are made with oblong holes in them, so as to open and shut, and close up alongside of the said beam, so as to form a straight fall, all substantially as described.

No. 27,278.—NATHAN S. DODGE, of Indianapolis, Ia.—*Improvement in Horse Powers.*—Patent dated February 28, 1860.—The dental projections c c are so paired and arranged in juxtaposition, as to brace and support each other, and enough of them linked together constitute the endless chain, and a basis for the wooden flexible tread of the platform B.

Claim.—The combination and arrangement of the peculiar shaped right angle braces c c, with the walking cleats B, and the tension rollers A A, substantially as set forth and for the purpose declared.

No. 27,279.—H. WILLIAM DOPP, of Buffalo, N. Y.—*Improvement in Sewing Machines.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the stationary bobbin case, the hook stretchers, and the thumb and finger, or their equivalents, so arranged as to cross the needle thread after it has been passed over the bobbin, so that the needle may pass down into this cross or loop of its own thread at each subsequent downward movement, for the purpose of running the under thread in a spiral form through a loop stitch, substantially as shown.

Second. The employment of the yielding tooth d, in combination with the vibrating bar k, when the same is used as a relief feed, substantially as specified.

No. 27,280.—EDWARD P. EMERSON, of Blairsville, Pa.—*Improved Composition for Paint.*—Patent dated February 28, 1860.—The inventor says: Provide two kettles of brass, iron, or copper; into kettle No. 1 put thirty-eight gallons of water, take sufficient of this to blend fine fourteen and a half pounds of wheat flour; when perfectly mixed, to be poured into kettle No. 1 that has the water in it, then add, previously well powdered, one hundred and fifty pounds of whiting, seventy-five pounds of pure white hydrate of alumina, the whole to be boiled and kept constantly stirring to prevent it from burning. Into kettle No. 2, put twenty-nine pounds of rosin, and add one gallon of boiled flax-seed oil, when that melts and begins to boil, add twenty-eight gallons of boiled oil; let it simmer, then pour it into kettle No. 1; it is then to be slowly simmered and thoroughly mixed until it forms one homogenous mass;

from this it is to be transferred into a mixing tub, where it is to be agitated thoroughly and well mixed; then to be added four hundred and sixty pounds of pure white silex, free of lumps; add to every hundred pounds of the entire mass sixteen and a half ounces of the silicate of soda, and eight ounces and a half of the sulphate of alumina. It may be levigated in the usual way of levigating or grinding other paints, and colored with any pigment not incompatible with any of the ingredients.

Claim.—The composition of ingredients and mode of manufacturing the fire and waterproof paint, substantially as described.

No. 27,281.—JOHN GORDON, of New London, Conn.—*Improvement in Watches.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with the elongated toothed curb lever *b*, of the arbor *f*, when the said arbor passes through the dial potence plate and cock, and is provided at one end with a pinion *e*, which gears with the teeth of the curb lever, and at the other end with a hand *z*, which moves over the surface of a recess *h* in the dial, which recess has a graduated scale, all as, and for the purpose, shown and described.

No. 27,282.—WILLIAM D. GRIMSHAW, of Newark, N. J.—*Improved Fire Alarm.*—Patent dated February 28, 1860; patented in England, December 29, 1858.—This invention consists in arranging an air tight vessel covered by an elastic diaphragm *B* and filled with air of somewhat higher pressure than that of the external air, in such relation to an index *F* that the expansion or contraction of the air contained in the air tight vessel *A*, caused by a change in the temperature of the surrounding air or gas, can be observed from the motion of the index, and also in combining with the said air tight vessel and index a quadrant *H* and an alarm bell *L* for making a noise.

The inventor says: I *claim*, first, the arrangement of the elastic diaphragm *B*, in the air tight vessel *A*, in combination with the index *F*, or its equivalent, constructed and operating substantially as and for the purpose specified.

Second. Combining with the vessel *A* and index *F* a quadrant *H*, or its equivalent, and alarm bell *L*, or its equivalent, substantially in the manner and for the purpose described.

No. 27,283.—SAMUEL ADAMS, of Toulon, Ill.—*Improvement in Mole Ploughs.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of the mole plough described, whereby the earth in the groove at the base of the drain is excavated and conveyed to the sides or top of the drain, substantially as and for the purposes set forth.

No. 27,284.—SAMUEL GILLESPIE, of New York, N. Y.—*Improved Folding Bedstead.*—Patent dated February 28, 1860.—This invention consists in dividing the side rails in or near the centre and hinging the parts to the head and foot of the bedstead, so that they can be folded down on the same in a compact manner.

Claim.—The combination and arrangement of the head and foot boards *c c*, hinged to side rails *A A*, and dovetail *B B*, substantially as and for the purpose specified.

No. 27,285.—GEORGE L. GRIFFIN and J. H. CARPER, of Dallas City, Ill.—*Improvement in Mole Ploughs.*—Patent dated February 28, 1860.—The nature of this invention will be understood by the claim and engravings.

Claim.—Constructing the sword with an advancing and receding angle which converge in a point in advance of the point of a mole, and directly above it, in combination with the said mole, in the manner and for the purposes fully described.

No. 27,286.—THEODORE S. HARRIS, of Boston, Mass.—*Improved Apparatus for Cleansing Tumblers, &c.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, an apparatus for washing and cleansing tumblers and other vessels, so arranged as to receive and hold the said tumblers, &c., in position, and having such an automatic motion, of any proper nature, imparted to it by any suitable machinery or means, as to bring the vessels to be cleansed in contact with, and expose them to, the action of a body or jet or shower of cleansing liquid, as set forth.

Second. The apparatus described and shown in the drawings, the same consisting essentially of a revolving platform *a a*, having compartments and partitions for the reception and holding of the tumblers, &c., and actuated by the force of a jet or shower of water or other liquid, as set forth.

No. 27,287.—HENRY C. HASKELL, of Marshall, Mich.—*Improved Pen Rack, Cleaner, and Pencil Sharpener.*—Patent dated February 28, 1860.—A light metal spindle *S* is provided with

an overhanging crank C at one end and a pencil sharpener D at the other, and is hung in bearings formed in the standards A A, so as to revolve at a proper height from the platform B; this spindle carries inside of the bearings a small fly wheel E at one end and a finger wheel F at the other, while the space between is filled with the cylindrically shaped brush G.

The inventor says: I *claim*, first, the use of the revolving brush G, in combination with the two wheels E F and crank C, substantially as and for the purposes described, when connected with a pen rack, as specified.

Second. Attaching to the end of the revolving spindle S any convenient pencil sharpener D, combined with an open box J to receive the shavings, as set forth.

No. 27,288.—URELI C. HILL, of Jersey City, N. J., and HENRY J. NEWTON, of New York, N. Y.—*Improvement in Musical Instruments*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the use of cast metallic forks in the place of forged ones previously used, when the same shall be arranged and operated as described.

Second. The combination of the strings *o*, sounding board P, cells A A, and forks C C, when arranged and operated as set forth.

Third. The combination of the over key H with the under key N, for the purpose of extending the action of the back ends of the under keys, when the same shall be arranged and operated as specified.

Fourth. Casting the forks C C in a cylindrical form, for the purpose of adding strength of vibration to the cells A A.

Fifth. The extension of the fork prongs F F, by soldering or rivetting soft metal G to the same, as described, for facilitating the tuning of the same.

No. 27,289.—J. W. HOARD and THOMAS A. SEARLE, of Providence, R. I.—*Improved Nail Plate Feeder*.—Patent dated February 28, 1860.—The nature of this invention is explained by the claim and engravings.

The inventors say: We *claim*, first, the employment, in combination with an apparatus for conveying and feeding the plates toward the cutters, of a box containing a pile of plates, the lower one of which is, by an automatic action, discharged sideways from the box and delivered to the feeding apparatus, in a direction transverse to the feed movement, as often as a new plate is required.

Second. The arrangement of the feeding apparatus, or that portion of it which holds the plate and moves it forward, to swing upward and downward on trunnions or with a lever-like movement, substantially as described.

Third. The barrel or conductor F, having attached the tongs and feed rollers, and furnished with a toothed wheel or sector N, through which it receives a movement back and forth on its axis, and a cam Q, through which it receives a longitudinal movement back and forth, as described.

Fourth. The arrangement of the sector O and cam P, in combination with the wheel or sector N on the barrel, substantially as described.

Fifth. The combination, with the eccentric groove *l* in the cam Q, of a lever-like bar R, furnished with a pin or projection *n*, and having applied to it a spring *p*, substantially as described.

Sixth. In combination with feed rollers, applied as described and furnished with ratchets, we claim the pawls *q q*, headed rods S, and ring *t*, applied in relation to the barrel or conductor F and the cylinder E, or bearing of said barrel or conductor, to operate the rollers, substantially as described.

Seventh. Controlling the action of the cam shaft D, by which the plates are discharged from the box B, by the action of the plates passing through a recess 7 in the barrel or conductor F, substantially as described.

No. 27,290.—W. W. HOWELL, of Columbus, Miss.—*Improvement in Cotton Gins*.—Patent dated February 28, 1860.—The cotton gin has a thrasher combined with it, and also a mote brush revolving in a reverse direction to the stripping brush. The thrasher cleans very dirty cotton before it passes to the gin saw. The saws gin or deprive the partially cleaned cotton of the seed; a conveyor carries off the seed; the cotton, after being ginned, is carried through the slitted breast and is met by a rapidly revolving mote brush which whips, with an upward action, the motes or imperfect seed out of the cotton while it is straddling the saw teeth.

The inventor says: I *claim* the arrangement and combination of the thrashing and preparing cylinder C, the folding top L, the conveyor *g g*¹, with the cotton gin, in the manner and for the purpose described.

I also claim the combination of a cylinder of ginning saws *m m*, the two brushes F and G, (one a dirt brush and the other a stripping brush,) the transverse shaft or air flue H *n*, and the longitudinal dirt discharge flue I, substantially as and for the purposes set forth.

No. 27,291.—JOHN S. HUGGINS, of Timmons ville, S. C.—*Improvement in Seed Planters*.—Patent dated February 28, 1860.—The drum B is charged with seed through the doors or opening sections, which are then locked with the bars *n*, and the team being attached to the forward end of frame *d*, and the handles D being grasped by the operator, the machine is to be drawn over the field; the share F forms the furrow, into which the seed is continuously discharged through the exits *a*, as the drum B rotates on its axis *s*.

The inventor says: I *claim*, first, the combination, with a series of discharge exits, of the series of shield plates *e*, adjustable cut-offs *o*, and guiding spout C, the whole constructed and operating as specified for the purpose set forth.

Second. The curved furrow former F¹ and shield plate *i*, in combination with the rotating seed drum B, guiding spout C, and shields *e*, the whole constructed and operating as specified, for the purpose set forth.

Third. The arrangement of the drum B, with its wheel heads A, with the continuous frame piece *d*, handles D, and furrow former F F¹, the whole constructed and operating as specified, for the purposes set forth.

No. 27,292.—L. D. HUNT, G. R. SHIPLEY, and B. B. HAWSE, of Morrisville, Vt.—*Improved Washing Machine*.—Patent dated February 28, 1860.—There are ribs *r* on the sides, bottom, and one end of the interior of the box B, to assist in cleaning the clothes, and at the other end is a rubber R, hinged at the bottom of the box, so as to allow it to oscillate with the revolution of the box, the tops of the ribs on either side near it being cut away obliquely so as to admit of its movement, and also prevent it from falling on the bottom of the box.

Claim.—The oscillating rubber R performing the double function of a rubber and of turning over the clothes, in combination with the square box B, having the interior ribs *r*, and operated by its partial revolution on journals *a*, substantially as and for the purposes set forth.

No. 27,293.—HENRY JOHNSON, of Washington, D. C.—*Improvement in Vapor Lamps*.—Patent dated February 28, 1860.—This invention will be explained by the claim and engravings.

The inventor says: I *claim*, first, the use of straight pipes B and C for conveying the fluid to the heater or generator A, and for conveying the vapor or gas from heater A to burner D, in vapor gas burners, operating as described and for the purposes set forth.

Second. I claim the heater or generator A, constructed as described, for conveying the heat to the fluid in the rear of the flame, operating as set forth and described.

Third. I claim placing the screw plugs *b* and *a* above and in right lines with the pipes B and C, as described.

Fourth. The burner D, constructed and operating as set forth and described, for the use of vapor gas generators.

No. 27,294.—HENRY ISHAM, of New Britain, Conn.—*Improvement in Locks*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the wheel on the key shaft having a rotary movement and a longitudinal movement in the direction of its axis, as described, in combination with the series of tumblers and the series of interposed wheels, substantially as and for the purpose described.

I also claim, in combination with the series of wheels which actuate the tumblers, and with the wheel on the key shaft, the cylinder on the key shaft and the locking segment, or either of them, the former operating as described, to lock and hold the said wheels in their normal position, and they, when out of their normal position, acting as stops to prevent the inward movement of the said cylinder, as described, and the latter operating, as described, to lock the said wheels in the position in which they are set by the wheel on the key shaft, as described.

I also claim making the bolt with one or two recesses in its edge, to fit the periphery of the cylinder on the key shaft, and with a cogged and non-cogged fillet by the side, in combination with the actuating or cog wheel and cylinder on the key shaft, and the space between the two, and the longitudinal movement of the wheel and cylinder, as described, whereby the cylinder locks the bolt until, by the longitudinal movement, the cylinder is removed out of the path of the bolt, and the wheel is brought into gear with the rack on the bolt to operate it as described.

No. 27,295.—JASPER JOHNSON, of Geneseo, N. Y.—*Improved Blind Operator*.—Patent dated February 28, 1860.—By turning the knob on the inside, the rod R moves up between the guides, pressing against the inner one *g*¹, which yields to it and opens the blinds half way, until the arm is turned in an upright position, when it presses against the outer guide *g*, and turning down again, it throws the blind entirely back.

Claim.—The curved guides *g g*¹ and bent rod R passing through the window frame, in combination with the blind and window frame, when said rod performs the double function of operating and fastening the blind, as set forth.

No. 27,296.—J. J. KENDALL, of Corinth, Miss.—*Improvement in Looms*.—Patent dated February 28, 1860.—This invention consists in certain arrangements whereby the vibration of the lay is made to impart motion to the harness at the proper time.

Claim.—Combining the cam shaft for operating the harness treadles with the lay by means of a wheel F with teeth on each side, pawls G G¹, a lever H, and a rod J, the whole applied and operating substantially as described, for the purpose specified.

No. 27,297.—EDWARD C. KNIGHT, of Philadelphia, Pa.—*Improvement in Couches for Railroad Cars*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Dividing a double couch, so constructed as to fold up by means of double hinged rods against the ceiling of a car, into two single couches, by making a third joint in the rods, so that either one double couch or two single couches may be formed, as desired, substantially as set forth.

No. 27,298.—RICHARD F. LOPER, of Philadelphia, Pa.—*Improvement in the Construction of Ships*.—Patent dated February 28, 1860.

The inventor says: The material from which I make the timbers and strengthening pieces is what is usually called "composition." They may be made of what is known as Muntz metal, or of any alloy of copper, zinc, and tin, or of copper and zinc.

Claim.—Constructing steamships, war and other vessels, in part of wood and part of "composition," as described, the parts of composition being formed with the recesses and connected to the wood, as set forth.

No. 27,299.—WILLIAM C. LUTZ, of Jacobs Church, Va.—*Improved Folding Bedstead*.—Patent dated February 28, 1860.—The side rail A¹ is provided with a rectangular mortise *a* at its foot, and with a partly rectangular and partly triangular shaped open mortise *b b* at its head, and the side rail A¹ is furnished with similar open mortises *c d d¹*, which are set in the reverse order of the mortises *a b b*.

Claim.—The arrangement of the peculiarly mortised and tenoned side and end rails, screw dowelled legs, screw tapped posts, and wedge keys, in the manner and for the purpose described.

No. 27,300.—WILLIAM P. MARTIN, of Salem, Mass.—*Improvement in Machines for Finishing Leather*.—Patent dated February 28, 1860.—This invention consists in the construction of the hand or tool holder, or in combining therewith and its tool a spring presser, whereby the tool will not be borne down upon the leather with too great rigidity, while it also aids in reducing any inequality which may be in the leather.

Claim.—Combining the hand or tool holder M and its tool *i*, spring presser or plate N; the same being applied, and made to operate therewith, substantially in the manner set forth.

No. 27,301.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Razor Straps*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, an India rubber or gutta percha razor strap, the hone side of which is formed of emery, sand, or other suitable gritty substance or substances, incorporated with India rubber or gutta percha, substantially as described.

No. 27,302.—JOSEPH B. MCENALLY, of Clearfield, Pa.—*Improved Paper and Letter File*.—Patent dated February 28, 1860.—This invention consists in using in connection with the hook or hooks B, cords or rods, one passing inside of each paper or letter, and leaving their ends attached to the ends of a cylinder A, and retained in proper position by means of spiral terminals *a*.

Claim.—The cylinder A, provided with the hook or hooks B and spiral terminals *a*, in combination with the cords or wires *d e*, being arranged substantially as and for the purpose set forth.

No. 27,303.—JACOB NEIMEYER, of Hamilton, Ohio.—*Improvement in Fastening Saw Handles*.—Patent dated February 28, 1860.—This invention consists in providing the cross-cut saw with a handle that holds with the necessary firmness when it is attached, and yet is easily and instantly removable whenever its removal is required.

Claim.—The compound saw handle described, the same consisting of the combination of the slotted rod B with the parts C and D of the handle and the nut E, all constructed, arranged and operating as and for the purpose specified.

No. 27,304.—JOHN H. NEVIN, of Ogdensburg, N. Y.—*Improvement in Gates*.—Patent dated February 28, 1860.—This invention consists in arranging a gate or door with a double spring hook, in combination with a double hand lever, and with two posts, whereby the gate or door fastens itself when it is shut as well as when it is opened.

Claim.—Arranging a gate or door with a double spring hook B, in combination with a double hand lever C, and with posts D and E, to operate substantially in the manner and for the purpose set forth.

No. 27,305.—MARK S. PALMER, of New Bedford, Mass.—*Improvement in Fishing Reels*.—Patent dated February 28, 1860.—This invention consists in the employment or use of a travelling or reciprocating line guide attached to the reel, and operating automatically, and in such a way as to cause the line as it is wound up to be adjusted evenly on the shaft of the reel.

The inventor says: I *claim* the reciprocating line guide D, applied to the reel, and operated from the gearing connected with the crank *e*, by the right and left screw shaft B, and pivoted nut E, substantially as set forth.

I further claim the arrangement of the pinions *j k*, socket *n*, and bar *g*, substantially as shown, to admit of the ready throwing in and out of gear of the shaft B, with the wheel *c*, as set forth.

No. 27,306.—G. W. PARROTT, of Lynn, Mass.—*Improvement in Sole Cutting Machines*.—Patent dated February 28, 1860.—This invention consists in governing the position of the knife bar and knife during their motions by means of an arm projecting from the knife bar, and guided by a slot or its equivalent.

Claim.—The bar J, attached to the cutter head, in combination with the slot *d*, or its equivalent, operating as set forth, to govern the motions of the cutter, for the purpose specified.

No. 27,307.—CHARLES B. PARSONS, of Burr Oak, Michigan.—*Improvement in Converting Reciprocating into Rotary Motion*.—Patent dated February 28, 1860.—This invention consists in the employment of an endless rack provided with grooves on its side, when used in connection with a gear wheel provided with an eccentric flange.

Claim.—The combination of the grooves *a a*, upon the sides of the rack F, with the eccentric flange C, at the side of the wheel H, when the two are constructed and arranged in the particular manner specified, and for the purpose set forth.

No. 27,308.—SILAS G. RANDALL, of Worcester, Mass.—*Improvement in Pumps*.—Patent dated February 28, 1860.—This invention consists in constructing the piston and valve chambers by uniting the mouths of two cup shaped sections G and H with each other and with the valve partition plate *m*, by means of a closely embracing thimble *d*, which is secured thereto by means of male and female screw threads.

Claim.—The union of the combined piston and valve chambers G and H, with the smaller delivery chamber B, by means of the eduction tube F, when the piston rod D of the pump is conducted from the latter to the former through said eduction tube, the whole constructed and arranged substantially in the manner set forth.

No. 27,309.—JOHN H. REDSTONE and ALBERT E. REDSTONE, of Indianapolis, Ind.—*Improvement in Shingle Machines*.—Patent dated February 28, 1860.—The lever H holds the table M, while the follower G is passed by the groove, and one revolution of the wheel A is made, and one shingle is cut from the block; the follower G is then passed by, or passes the crossing which unites the grooves R and S, when the table M is vibrated or reversed.

Claim.—The cross grooved wheel F, follower G, lever H, when used in connection with the grooved cam B, the slotted bar D, knife plate E, and table rest M, or their equivalents, as set forth.

No. 26,310.—LAWRENCE REID and JOHN ROGERS, of New York, N. Y.—*Improvement in the Manufacture of Glue*.—Patent dated February 28, 1860.—This invention consists in the combined application of heat and alkaline and earthy alkaline substances to the skins or sinews of animals, or such parts of animals as are generally employed in the manufacture of glue.

Claim.—The rapid preparation of glue and gelatine of better quality and increased quantity from skins and sinews by the method described.

No. 27,311.—JOHN RICHARDSON, of New York, N. Y.—*Improved Pen and Pencil Case*.—Patent dated February 28, 1860.—The tubes C D E, with the pencil shaft E¹, may be drawn out from, and shoved into, the shell A, the tube B remaining therein. By turning the head *c* from left to right the tube B will be turned, and the latter will act against the stud *h*¹, and cause the pencil shaft E¹, to be thrown out.

Claim.—The combination of the spirally slotted tubes D F, longitudinally slotted tubes B G, extension tube C, and shell A, arranged to operate as and for the purpose set forth.

No. 27,312.—ALONZO R. ROOT, of Canton, Mo.—*Improvement in Seeding Machines.*—Patent dated February 28, 1860.—This invention consists in arranging in one end of a cylinder a hollow revolving triangular head, with openings in the angles of the same for the full escape of the seed, and upon which are secured radial tubes for distributing the seed broadcast as the head is rotated by a shaft passing longitudinally through the centre of the cylinder.

The inventor says: I *claim*, first, the employment of the hinged screen S within the hopper, in combination with the agitator R, as and for the purpose shown and described.

Second. The arrangement of the feed regulating screw M, sliding block f, stem c, block b, and hollow shaft K, as and for the purpose shown and described.

No. 27,313.—THOMAS SAULT, of Seymour, Conn.—*Improved Air Trap for Steam Engines.*—Patent dated February 28, 1860.—The claim and engraving explain the nature of this invention.

Claim.—The air trap composed of a valve of hard vulcanized India rubber, constructed and applied to operate, substantially as described, between two opposite seats and orifices in a box of metal or other material, whose expansibility by heat is less than that of the valve

No. 27,314.—WILLIAM SHARP, of Catharine, N. Y.—*Improvement in Boxes of Carriage Wheels.*—Patent dated February 28, 1860.—This invention consists in employing conical, or bevelled bearings of unequal inclinations at each end of the hub, having their inclinations in reversed or opposing directions.

Claim.—Constructing the wheels of carriages and other vehicles with reversed bevelled bearings and boxes F G of corresponding form, the outer of said bearings having the *greater* inclination of the two, substantially as and for the purpose set forth.

No. 27,315.—SAMUEL J. SHAW and H. J. BATCHELDER, of Marlborough, Mass.—*Improved Lantern Carrier.*—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The lantern carrier, constructed as described, and for the purpose of supporting a lantern against the breast of a person, and having both arms free to be moved in any direction.

No. 27,316.—ANDREW L. SIMPSON, of Durham, N. H.—*Improvement in Reefing Sails.*—Patent dated February 28, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the application of the connected blocks, or equivalents, to the sail and the topsail yards, so as to roll about the yard with the sail, substantially in manner and for the purpose specified.

I also claim the adjustable clasp W, made in two parts, and provided with a screw or screws for connecting them to the sail and adjusting them with reference to the guide rope, as described.

I also claim the application of the covering strip X to the topsail and its opening, in such manner as to enable the said strip to be slid up and down on the sail and to or near the foot thereof, in manner substantially as described.

No. 27,317.—SAMUEL SOLLIDAY, of Sumneytown, Pa.—*Improved Safety Casing for Steam Boilers.*—Patent dated February 18, 1860.—This invention consists in constructing a casing or well for the reception of the boiler of a strong frame work of timber having a lining of stout boiler iron, said casing extending above and below deck, and having a covering of lighter construction than the other parts which, in the event of explosion will be blown off, and the results of the explosion thus be left free to be discharged into the water.

Claim.—The encasing of marine steam boilers within a chamber of sufficient strength to withstand the effect of explosion in all parts except its top, as set forth.

No. 27,318.—JAMES STILLEY, of Cincinnati, Ohio.—*Improved Bread Slicer.*—Patent dated February 28, 1860.—This invention consists of a knife or cutter set diagonally in a rectangular sliding frame adapted to pass through a suitable angular abutment against which the material to be cut is placed, said frame being also provided with an adjustable gauge by which the thickness of slices of bread to be cut may be regulated.

Claim.—The combination of the abutment board A¹, knife C, clearer e, and adjustable gauge F, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 27,319.—ORSON W. STOW, of Plantsville, Conn.—*Improvement in Bending Sheet Metal*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, making the folding bar commonly used in such machines in two parts *f* and *i*, one part *i* being adjustable in respect to the folding plate *e*, by means of set screws *n*, or other equivalent means, so as to form a close or open lock for joining two pieces of metal plate or closing around a wire, substantially in the manner described.

Second. I claim arranging the gripping jaw *S*, with the folding bar *f* and *i*, in such manner that, on motion being given to the folding bar *f*, on its axis *g*, the gripping jaw *S* is made to close on the folding plate *e*, and at the same time carry along with it the folding bar *f*, into such a position as will bring its axis *g* of motion, nearly into a line with the edge of the folding plate *e*, thereby placing the folding plate *f* and *i* in position to be turned over on to the folding plate *e*, necessarily and simultaneously with the motion of the folding bars *f* and *i*, on its axis *g*, substantially in the manner as described.

Third. I claim the bed plate proper *a a*¹, to which is secured the folding plate *e*, in combination with the hinged frame *b*, having journal boxes *d*, and gripping jaws *S*, the folding bars *f* and *i*, fixed or adjustable, and having journals *g*, cams *o*, arranged and operating together substantially in the manner and for the purpose described.

No. 27,320.—GEORGE C. TAFT, of Worcester, Mass.—*Improved Drill*.—Patent dated February 28, 1860.—The nature of this invention is explained by the claim and engraving.

The inventor says: I *claim* the arrangement and application of the support piece *S*, the slide rod *I*, the drill shaft and the pawl operating mechanism, as specified, whereby, by the said support piece, not only the vibrating lever *K*, of the pawl, but other mechanism, and particularly an arbor *R*, and an internal gear *Q*, can be sustained and employed to advantage, as explained.

I also claim the arrangement and application of the cammed post *V*, or its equivalent, with respect to the puppet *a*, the ratchet *O*, and pawl *N*, as described.

No. 27,321.—JOSEPH C. TUCKER, of New York, N. Y.—*Improvement in Defecating and Decolorizing Saccharine Juices*.—Patent dated February 28, 1860.—The hydrated alumina may be used in refining sugar either with or without animal charcoal. The claim will explain the nature of this invention.

The inventor says: I *claim*, first, the application, in the refining of sugar or saccharine liquids, for decolorizing or defecating the same, of hydrated alumina, when the same is prepared by decomposing a solution of sulphate of alumina by means of cream of lime, as set forth.

Second. In combination with the foregoing, I claim the method described of separating gypsum from the hydrated alumina by agitating the same, with water and allowing the former to subside, and by drawing off the supernatant hydrate of alumina, substantially as set forth.

No. 27,322.—SILAS O. VAUGHN, of De Kalb, Ill.—*Improvement in Ploughs*.—Patent dated February 28, 1860.—This invention consists in the manner of attaching the beam of the plough to the landside handle, and also to the standard, whereby the beam is rendered capable of being adjusted both laterally and vertically to regulate the width and depth of the furrow as may be desired.

Claim.—The arrangement of the rod *J*, beam *F*, standard *I*, taper hole *e*, strap *G*, screw *a*, slots *b*, eye *H*, plates *c c*, handle *D*, and landside *A*, as shown and described.

No. 27,323.—WILLIAM A. VERTREES, of Winchester, Mo.—*Improvement in Harvesters*.—Patent dated February 28, 1860.—The nature of this invention will be understood by the claim and engravings.

Claim.—The combination with the slotted fingers *d d*, of a cutter having on the same blade a double row of teeth, the upper row having its cutting edges in the plane of the upper surface of the blade, and the teeth in the lower row having their cutting edges in the plane of the lower surface of the blade, and being placed intermediate to the teeth in the upper row, as described, in the construction of reaping machines.

No. 27,324.—AUGUSTUS WATSON, of Loudon, Ohio.—*Improvement in Lining Underground Drains with Cement*.—Patent dated February 28, 1860.—This invention consists in plastering or cementing the arch or crown, and the sides, or either, of underground drains while they are in process of being made, the object being to cause the drain to maintain its form and not fall in, while the bottom portion is left uncemented to allow the water to enter the drain.

Claim.—In combination with a mole for forming an underground drain, a tube for conveying cement or other plastic lining material down to the drain, in such manner that it may be spread by a trowelling mole upon such parts of the drain as may be desired, substantially as described.

No. 27,325.—WILLIAM D. WALKER, of Livonia, N. Y.—*Improvement in the Method of Regulating Wind Wheels*.—Patent dated February 28, 1860.—The movements of the ratchet bar are governed by the ball *g*, hung in such a way that, as the speed of the wheel increases, the centrifugal force carries it outward, which pushes the bar *k* in, through the intervention of the connecting parts *j*, *l*, and *m*, and brings the ratchet teeth into connection with *a*, thus preventing the further expansion of the sail *C*.

Claim.—The combination and arrangement of the balls *g*, compound sliding ratchet bar *k*, hand regulator *s*, *r*, and *o*, as described, with the sails *C*, substantially in the manner and for the purposes set forth.

No. 27,326.—PETER WEILER, of New York, N. Y.—*Improved Machine for Cutting Veneers*.—Patent dated February 28, 1860.—This invention consists in the arrangement of a rotary log carrier with the knife or cutting tool, in such a manner as to produce a simultaneous vertical or longitudinal or drawing cut during the whole time which the knife or tool takes to pass through the log for the purpose of facilitating the cutting operation, and in combination with a rotary log carrier, a tank containing a suitable fluid, and capable of being heated.

The inventor says: I *claim*, first, the use and employment of a rotary log carrier for the purpose of cutting veneers, substantially as specified.

Second. The combination of a rotary log carrier with a knife, in such a manner that the knife may either be moved towards the rotary log carrier, or the knife remain stationary and the rotary log carrier moved towards the knife, for the purpose specified.

Third. The combination of a rotary log carrier and the knife when a lateral motion is given to the knife, or a lateral motion is given to the rotary log carrier, to produce a drawing cut upon the wood, for the purpose of facilitating the cutting operation.

Fourth. The arrangement and combination of a rotary log carrier with a tank *K*, or its equivalent, containing a suitable fluid and capable of being heated and kept hot, and causing the logs to pass through said heated liquid during their revolution, in the manner and for the purpose as described.

Fifthly. Combining with the knife the gauge bar *Q*, in the manner and for the purpose substantially as described.

No. 27,327.—FRANKLIN W. WILLARD, of New York, N. Y., assignor to himself and E. G. ALLEN, of Boston, Mass.—*Improvement in Apparatus for Distilling Coal Oil*.—Patent dated February 28, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of a series of valves *i i*, and ports, in combination with the revolving retort *a a*, so operating as to always leave open one or more of the said ports at the upper portion of the retort, and keep the remaining ports at the lower portion thereof closed, substantially as described, and for the purpose specified.

No. 27,328.—THOMAS BELL, of New York, N. Y., assignor to himself and C. GODFREY GUNTHER, of said New York.—*Improvement in the Construction of Vessels*.—Patent dated February 28, 1860.—This invention consists in having two skins or an inboard and outboard planking, which are put together and secured in such a manner that oakum cannot be driven through between the boards; and in the event of a leak or break through both skins, the leak may be readily found on the inboard side and repaired.

Claim.—The combination of the locust treenails *c*, and wedges *d*, with the inboard planking or frame *E*, and outboard planking *F*, when the apertures which receive the treenails are made tapering in form, and the ends of the nails split and countersunk, as shown and described, for the purpose set forth.

No. 27,329.—WILLIAM BERG, of New York, N. Y., assignor to NESTOR HOUTON, of said New York.—*Improved Wardrobe Bedstead*.—Patent dated February 28, 1860.—The bed and folding portion are supported while folding upon the cams 16, subject however to the restriction exercised by the pins 17, working in the slots in the plates 19, which plates are attached to each of the side pieces 22, the projecting side bearings 18 resting upon the cams 16 for that purpose.

Claim.—The arrangement of the cams 16, supporting ledges or side bearings 18, pins or axes 17, slotted guides and bearing boxes 19, arranged in connection with each other and with the bed frame and case as described; the whole being constructed substantially as and for the purpose set forth.

No. 27,330.—CHARLES J. BRADBURY, of Boston, Mass., assignor to PAUL P. TODD, of Blackstone, Mass.—*Improved Bell Pull*.—Patent dated February 28, 1860.—This invention consists of a knob and handle *A*, with a shank *a*, having its end turned down, and a thread *b* cut upon it, an auxiliary spring *C*, and an adjustable nut *D*, having a slit cut in one end to

accommodate the lever E, and the other end tapped so as to screw on to the end of the shank *b* of the knob and handle A.

Claim.—The arrangement of the spring C, the knob A, and nut D, the shank *a*, the screw *b*, and the lever E, substantially as and for the purpose specified.

No. 27,331.—JOSEPH G. FULLER, of Brooklyn, N. Y., assignor to STEPHEN HALSTEAD, JR., of said Brooklyn.—*Improved Composition for Painting the Bottoms of Vessels, &c.*—Patent dated February 28, 1860.—The inventor says: To one pound of India rubber I apply about one gallon of pure spirits of turpentine, and allow the same to thoroughly dissolve. I then take about twenty pounds of rectified brimstone, and mix therewith the said rubber paste together with about one gallon of linseed oil, and one gallon of gas tar. I also add one pound of powdered verdigris, and one pound of burnt blue vitriol. I permit the compound to remain for about twelve hours, that the various ingredients may become thoroughly mixed or infused, and then add two gallons of linseed oil.

Claim.—The compound of brimstone, tar, rubber, verdigris, and oil, substantially in the proportions and for the purposes specified.

No. 27,332.—JOHN B. JONES, of Williamsburg, N. Y., assignor to Himself, S. W. WALDRON, JR., of Brooklyn, N. Y., and F. F. HALL, of Boston Mass.—*Improvement in Lanterns.* Patent dated February 28, 1860.—This invention consists in cutting or punching suitable slots through angular corners of the uprights or frames for holding the glass plates of the lantern at suitable points for receiving the guard wire, and in securing the wire or wires at said points around the lantern and to the said uprights by passing a suitable wire rod or rods through eyes or loops, which are previously formed at those points upon the guard wire, to be attached to the uprights, which loops project through the slots.

Claim.—The combination of the perforated angle strips E, with the corrugated perforated corner pieces C, guards G, loops or eyes *b*, vertical rods and glasses D, as and for the purpose herein shown and described.

No. 27,333.—ROBERT McLARDY, of Pittsburgh, Pa., assignor to W. McCULLY & Co., of said Pittsburgh.—*Improvement in Tools for Forming the Necks and Orifices of Glass Bottles.* Patent dated February 28, 1860.—This invention consists in making the lugs and plugs of tools for forming the neck and mouth of glass bottles of cast iron instead of steel.

Claim.—Making the lugs and the plugs of cast iron instead of steel, for the purposes before described.

No. 27,334.—HENRY D. MUSSELMAN, of Lancaster, Pa., assignor to himself and WILLIAM D. SPRECKER, of said Lancaster.—*Improved Meat Chopper.*—Patent dated February 28, 1860. The claim and engravings explain the nature of this invention.

Claim.—The series of independent springs M, operating separately on the handles N of the choppers O, in combination with the double removable cross pieces K L, between which they are held, and the adjusting thumb screws X, together with the square-headed and screw-ended pivot rod or bolt I, with its screw-threaded and handled bar P, as also the eye *d*, chopper handles N, when combined in the manner set forth, for the purposes specified.

No. 27,335.—JOHN L. ROWE, of New York, N. Y., assignor to himself and R. F. CLOW, of said New York.—*Improved Police Club.*—Patent dated February 28, 1860.—This invention consists in so arranging a sheath B to fit upon the club A, that when the club is grasped by an opponent, the officer, by actuating the spring catch C, releases the sheath, which is the only part that can be seized or grasped by the opponent, and consequently liberates the club.

Claim.—The employment or use of a sheath B, applied to or fitted on a policeman's club A, substantially as and for the purpose herein set forth.

No. 27,336.—HENRY A. SEYMOUR, of Bristol, Conn., assignor to F. E. DARROW and WILLIAM WEBSTER, of said Bristol.—*Improved Thermostat.*—Patent dated February 28, 1860.—This invention relates to the mode employed to regulate the action of the lever and spring upon the indicating pointer, produced by the expansion and contraction of a ring-shaped metallic bar, composed of two different compositions, secured together, the ring being cut, and one end firmly secured, and the other end free to act, or to be acted upon by the atmosphere to which it is exposed, causing a pointer to indicate upon a dial the variations of the temperature or degree of heat.

The inventor says: I claim forming a connection from the long end of the lever *f*, to and around the pointer spindle *k*, to the end of the tension spring *l*, substantially in the manner as and for the purpose described.

Second. I claim the employment of the button *e* upon the end of the ring-shaped metallic

bar *a b*, to nicely adjust the action of said bar upon the pointer *n*, through the lever *f*, connection *o*, spindle *k*, and spring *l*, arranged and operating substantially as described.

No. 27,337.—SAMUEL LA FORGE, of Cleveland, Ohio.—*Improvement in Waterproof Leather Goods*.—Patent dated February 28, 1860.—The claim will explain the nature of this invention.

Claim.—The article of manufacture herein named, prepared from the undressed skins, exposed to heat, coated with the charged leather solution, and then subjected to the vulcanizing process, as herein set forth.

No. 27,338.—DENNIS ALDRICH, of St. Louis, Mo.—*Improvement in Preparing Hides*.—Patent dated March 6, 1860.—The inventor says: I first soak the hides in clean water until they become limber, and then immerse them in acid liquor, composed of one part of acetic acid, and sixteen parts of water, allowing them to remain in this liquor until the scale is perfectly dissolved. I then place them in a bath composed of seventy parts of water and one part of carbonate of ammonia.

Claim.—The treatment of hides successively with diluted acetic acid, and a solution of carbonate of ammonia, substantially as and for the purpose specified.

No. 27,339.—JOHN ALLISON, of St. Martinsville, La.—*Improvement in Cane Coverers*.—Patent dated March 6, 1860.—The object of this invention is to obtain a machine for covering cane that will during the operation pulverize the earth and cause the seed to be covered with a loose, light, and friable mould permeable to air and moisture.

Claim.—The boards or planks *A A*, with blades *D D*, rotary harrow *J*, and adjustable harrow *K* attached, the frame *E* provided with the roller *F*, scraper *G*, and one or more rotary harrows *H I*, the whole being combined and arranged for joint operation as and for the purpose set forth.

No. 27,340.—JOHN ARMSTRONG, of New Orleans, La.—*Improvement in Steam Boilers*.—Patent dated March 6, 1860.—The claim and engravings will explain the nature of this invention.

The inventor says: I claim the combination of the upright water vessels *A A A*¹, horizontal connecting cylinders *B B* and flues *b b*, the said vessels *A A A*¹ being arranged substantially as described, that their upper portions may constitute steam spaces and their lower parts sediment collectors, as set forth.

And in combination with the said upright water vessels *A A A*¹, horizontal connecting cylinders *B B*, and flues *b b*, I claim the return flues *C C*, passing through the said water vessels and connecting cylinders, as specified.

No. 27,341.—EDWARD H. ASHCROFT, of Boston, Mass.—*Improved Pressure Gauge for Steam Boilers*.—Patent dated March 6, 1860.—The inventor says: I affix on the arbor *a* of the index pointer *b* of the gauge, a wheel or barrel *c*; to this wheel I affix one end of a chain *d*, and wind such chain around the periphery of the wheel and fasten the outer extremity of the chain to the upper end of the superior arm of a bent lever *e*, arranged within the gauge case *A*, and so as to turn on a fulcrum *f*. The inferior arm of the lever is jointed to a rod or bar *g*, so connected with the elastic diaphragm *h* as to be moved thereby and therewith.

Claim.—The improved locomotive engine boiler steam gauge, as made with the coiled spring, the chain and lever arranged and applied directly to the diaphragm rod, and the index pointer shaft, in manner, and so as to operate, substantially as described.

No. 27,342.—J. B. ATWATER, of Ripon, Wis.—*Improvement in Rifled Fire Arms*.—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Constructing the barrel, substantially in the manner set forth, to wit: with a diminished number of rifles or grooves, from or from near the centre or middle of the barrel to its muzzle, for the purpose of diminishing the friction of the ball after the powder has exerted its expansive force upon it, as is specified.

No. 27,343.—FRANCIS BASCHNAGEL, of Beverly, Mass.—*Improved Plastic Compound*.—Patent dated March 6, 1860.—A detailed description of this compound would require too much space to be given here. The claim will explain it in part.

Claim.—Combining the powder of leather, previously boiled and dried, with a mixture of solutions of glue and tannin to form a plastic compound, which may be modified and treated in the manner substantially as specified.

No. 27,344.—ALBION BEAN, of Dedham, Mass.—*Improvement in Railroad Car Brakes*.—Patent dated March 6, 1860.—The two weights *F F* are hinged together at *h*, from which

a chain G is led upward and around a guide sheave I, supported by a fork K sustained by the platform frame. From thence the chain is led to a hand windlass L applied to the end of the platform and provided with a ratchet *m* and pawl *n*.

The inventor says: I *claim* the arrangement and application of the lever weight with respect to the trunk frame, the brakes, and the hand windlass, substantially in manner and to operate as described.

I also claim so connecting the two lever weights of the two adjacent truck frames that both be raised by one chain, or its equivalent, applied to either, as set forth.

No. 27,345.—JOHN H. BLOODGOOD, of New York, N. Y., and MOSES A. JOHNSON, of Lowell, Mass.—*Improvement in Felting Machinery*.—Patent dated March 6, 1860.—The shaft K carries a worm M which engages with the wheel N, upon the shaft O of the roll E, by which means motion is communicated to the apron D, which in return revolves the rubber C, the apron being pressed up with sufficient force against the rubber for this purpose.

The inventors say: We *claim* an elastic traversing apron moistened and warmed by steam, and as the sole bed for the material that is being felted, in combination with a revolving vibrating felt, operating in the manner substantially as described, for the purpose set forth.

Second. We claim a felting, or rubbing surface for felting machines, composed of the end grain of wood, and operating as described.

Third. The device for keeping the apron straight upon its roll, consisting essentially of the independent end pieces S, cord *t*, and spring P, or their equivalents, operating substantially as set forth.

No. 27,346.—JAMES LAWRENCE BUTLER, WILLIAM S. HOSFORD, and D. WALTER SMITH, of Brooklyn, N. Y.—*Improvement in Burners of Vapor Lamps*.—Patent dated March 6, 1860. The tube of the jacket A is made of thin brass or copper, the portion *a a* being expanded outwardly, so as to receive the shank of the heater, when the jacket is received on the burner tube *c*. The shank pieces of B, in this case, are kept in place by the pressure of the burner tube on the inside and by expansion *a* on the outside.

Claim.—The construction of the adjustable thimble or jacket A A, with expansions or ears *a a*, and the adaptation thereto of removable heaters B B, for the purpose set forth.

No. 27,347.—JOSHUA F. CAMERON, of Livingston, Mo.—*Improvement in Shovel Ploughs*.—Patent dated March 6, 1860.—In the drawing, A represents the beam of the plough; B the standard, whose curve is the arc of a circle, having its anterior edge made of an oval form to admit the turning of the face of the shovel inward or outward; C is the shovel curved like the standard B, attached to the latter by means of a hinge screw D, and is prevented from sliding by the rods E E passing through the standard; F F are set screws, working through nuts inserted in the standard.

Claim.—The arrangement of the beam A, standard B, shovel C, hinge screw D, rods E E, and set screws or pivots F F, as described, for the purposes set forth.

No. 27,348.—WILLIAM B. CARGILL, of Waterbury, Conn.—*Improvement in Hand Cotton Pickers*.—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the reciprocating gatherer, arranged and operating substantially as described, whereby I am enabled to keep steadily in contact with the balls the said gatherer for extracting the cotton, as set forth and specified.

I also claim in the combination with the reciprocating gatherer, the stationary stripper for discharging the cotton from the said gatherer, as set forth and specified.

I also claim widening that portion of the gatherer which is always in the case for the more perfect delivery of the cotton to the receptacle, and to prevent clogging within the case, as set forth and specified.

No. 27,349.—LUCIUS CARRIER, of East Douglass, Mass.—*Improvement in Knife Handles*.—Patent dated March 6, 1860.—The strips of horn *a a b b* extend the whole length of the handle, and they are covered by a piece of horn *d*, which is bent around said pieces and is secured thereto by bolts *e*, a necessary number of which pass through the tang *c*, and not only secure the cover *d* to the body or filling of the handle, but also secure the handle to the tang.

Claim.—As an improved article of manufacture, a knife handle formed of a body or filling of horn, wood, or other suitable material, secured by a single piece of horn, substantially as described.

No. 27,350.—N. R. CARRINGTON, of Cold Water, Miss.—*Improvement in Seed Planters*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the seeding wheel H, constructed as described, the projecting arms *d d* alternating in action on the opposite sides of said seeding wheel, and the tangential sliding gate I, substantially as specified, and in combination therewith the false floor L, for adapting the variations of the seeding wheel to different kinds of seed, as set forth.

No. 27,351.—AUGUSTUS CONRADT, of Philadelphia, Pa.—*Improvement in Forming Hollow Articles of Sheet Metal.*—Patent dated March 6, 1860.—This invention consists in the construction of an apparatus for forming up the angular or prismoidal and other shaped hollow ornamental or useful articles (deviating in their circumferences from the circular form) of sheet metal, by the process of spinning.

The inventor says: I *claim* causing the mandrel A, whilst rotating, to vibrate or move laterally, under the combined influence of the governor *l*, pattern C, and springs *i i*, or their substantial equivalents, in the manner and for the purpose set forth and described.

I also claim giving the said mandrel A, whilst rotating, a longitudinal motion, when required, by means of the governor *l*, pattern C, and spring *f*, or their equivalents, substantially as and for the purpose set forth and described.

No. 27,352.—B. F. CARRIER, of Bath, Me.—*Improvement in Machines for Cutting up Cotton Plants.*—Patent dated March 6, 1860.—This invention consists in a machine for cutting the cotton stubble into short pieces and for pulling up the roots or stumps of the plants and dropping them in rows on the ground, so that they may be readily turned under by the plough.

Claim.—The revolving knives or cutters *i* and the pulleys *n p*, with their band *o*, operating substantially as described for the purpose specified.

No. 27,353.—JAMES C. DAMAN, of Hartford, Conn.—*Improvement in Machines for Extracting Stumps.*—Patent dated March 6, 1860.—This invention consists in the employment or use of two rack bars, fitted in a suitable framing, and used in connection with sliding catches, and a lever or levers, whereby the work of drawing stumps from the earth may be effected by a single person.

Claim.—The arrangement and combination of the connecting bar C D, the rod *i*, sliding frames F G, springs *h j*, link I, and lever H, as and for the purpose shown and described.

No. 27,354.—HENRY DISSTON, of Philadelphia, Pa.—*Improved Method of Securing Handles on Hand Saws.*—Patent dated March 6, 1860.—This invention consists in attaching the blade of a hand saw to the handle by means of taper pins screwed at the ends and furnished with nuts, so that when the blade, by constant or excessive strains, becomes loose in the handle, it may be readily tightened.

Claim.—The application of the taper pins *e e*, with the screwed ends and their nuts *f*, to the manufacture of hand saws, in the manner and for the purpose set forth.

No. 27,355.—H. WILLIAM DOPP, of Buffalo, N. Y.—*Improvement in Steam Engines.*—Patent dated March 6, 1860.—This invention consists in providing the valve balance with a piston or packing, said valve balance being stationary, but so arranged that it may, by the action of the steam, be kept in contact with the valves, and a variable cut off, which consists of a cam groove, to disconnect the valves from their respective motions.

The inventor says: I *claim*, first, the stationary valve balance B, constructed as described, in combination with steam valves A A, or their equivalents.

Second. I claim sliding valves A A, when the same are constructed and used in the manner and for the purpose set forth.

Third. I claim the employment of link, crank, or arm, as shown by link *k*, in combination with pistons M M and valves A A, as constructed.

Fourth. I claim the combined rocking valve gear, when the same shall be constructed substantially as and for the purpose set forth.

Fifth. I claim the employment of a cam groove around the shaft J, in combination with hooks *k k*.

No. 27,356.—DARWIN P. FLINN and RICHARD S. HAYES, of Le Roy, N. Y.—*Improvement in Corn and Cane Harvesters.*—Patent dated March 6, 1860.—This invention consists in the manner of gathering and presenting the stalks to the cutters, and also of conveying the stalks to rotary and intermittingly moving platforms, whereby the stalks are gathered and cut into gavels, and bound by an attendant, and cast from the machine as it moves along.

The inventors say: We *claim*, first, the employment or use of the shafts *f*, provided with the spiral wires E, and the shafts *h h*¹, provided respectively with the spiral wires F, and cylinder *i*, in connection with cutters H, arranged to operate substantially as and for the purpose set forth.

Second. The stationary and yielding fingers $l l^1$, in connection with the shafts $f h h^1$, provided with the spiral wires and cylinders, arranged for joint operation, as set forth.

Third. The movable platforms $I I$, provided with the rotary beds a , in connection with the fingers $l l^1$, or an equivalent stalk holding device, for the purpose specified.

No. 27,357.—JOSEPH W. GARDNER, of Shelburne Falls, Mass.—*Improvement in Table Cutlery*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An improved manufacture of knife or fork as made not only with a flat or sheet metal shank A , and with the scales $C C$ applied on opposite sides thereof, but with two separate semi-bolsters D applied relatively to the shank and scales and fastened thereto, substantially as specified.

No. 27,358.—WILLIAM M. GAREE, of Granville, Ohio.—*Improvement in Corn Planters*.—Patent dated March 6, 1860.—The hopper l^2 having been filled with corn, and the handles $j j$ being extended, the operator closes the handles, which movement fills the charger. The handles are then opened, by which the seed contained in the charger are caused to fall into the chamber $l l$, at the same time the jaws at the bottom are tightly closed and ready for entrance into the earth. The jaws are then thrust into the earth and the handles closed, by which movement the seed in the chamber $l l$ are allowed to fall into the earth, and the charger m is again filled.

Claim.—The arrangement of the flanch C , seed slide or charger m , plate n , brush block e , chamber $l l$, uprights $1 2 3$, lid p , and jaws $b b$, as and for the purpose shown and described.

No. 27,359.—EDWARD W. GORDON, of New York, N. Y., and WILLIAM H. PECKHAM, of Hoboken, N. J.—*Improved Spectacle Temples*.—Patent dated March 6, 1860.—This invention consists in providing spring stops $e i$, which act not only to arrest and determine the movement of the slide d , but also to render said slide uniform in its movement.

Claim.—Constructing the hollow temples and slides of spectacles with both of the spring stops $e i$, substantially as and for the purposes specified.

No. 27,360.—H. GORTNER and J. McCANN, of Nashport, Ohio.—*Improvement in Corn Harvesters*.—Patent dated March 6, 1860.—This invention consists in the employment of a peculiarly shaped rotary cutter, for giving an oblique draw cut, and operated by the driving wheel; and also in a platform H for receiving the stalks as they are cut by the knives, and discharge the same at one side of the machine in a suitable condition for binding in shocks.

The inventors say: We *claim*, first, the hinged frames $G G^1$ and H , bend c , roller D , with cords F , all arranged, combined, and operating in the manner and for the purposes set forth.

Second. We claim the convex knife rest N , with rotary sickle blade cutters L , as represented and described, for the purpose specified.

No. 27,361.—JOHN H. GOVE, of San Francisco, Cal.—*Improvement in Hay Presses*.—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* the cross arms or levers $F F$, working in journals upon a movable platform at one end, in connection with the chains or ropes $c c$, one end of which is attached to the cross bars $H H$, the other fastened to and winding upon a shaft a .

I claim the arm n of lever m , combined with catch springs o , as arranged with the cross bar H , for the purpose of automatically disconnecting the pressing gear at the proper time, as set forth.

I claim the sliding bar r , with the hooks $s s$, roller t , and spring V , for the purpose of releasing the rope or wire, as set forth.

I claim the combination of the shaft a , chains or ropes $c c$, and arms or levers $F F$, when operated by the axle of a carriage, substantially as described, and for the uses and purposes as set forth.

No. 27,362.—JOHN R. GRACE, of Brooklyn, N. Y.—*Improved Surf Life Boat*.—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the employment of a central ballast chamber c , when combined with two air chambers b , substantially as shown and described.

Second. I claim the combination of the air chambers $g g$, with the ends of boats that are so curved that when the boat is capsized the boat shall be mainly supported upon said air chambers, as and for the purpose shown and described.

Third. I claim the vertical and endwise arching of the chambers $g g$, as and for the purpose set forth.

No. 27,363.—W. W. GREEN, of Chelsea, Ill.—*Improvement in Cultivators*.—Patent dated March 6, 1860.—This invention consists in the arrangement for elevating and depressing

the shares, so that the same may when in operation be made to penetrate the earth at a greater or less depth as circumstances may require.

The inventor says: I *claim*, first, having the wheels *c c* of the implement attached to vertical perforated bars *g g*, which pass loosely through the back part of the frame *A*, in connection with the adjustable draught pole *B*, the whole being arranged as and for the purposes set forth.

Second. Attaching the shares *D* to their standards *j*, by means of the sockets *l*, plates *q*, and bolts *n*, the sockets and plates being attached respectively to the shares and standards, and the bolts passing through the sockets, plates, and standards, the bolts passing through transverse slots *m*, in the sockets and projections *r*, on the plates, the whole being arranged as and for the purpose set forth.

No. 27,364.—GEORGE W. GRAEBER, BENJAMIN F. COWAN, and A. C. WURZBACH, of Memphis, Tenn.—*Improved Gauge for Steam Boilers*.—Patent dated March 6, 1860.—This invention consists in a system of valves and passages by which steam is admitted to act upon a whistle or other device to sound an alarm in case of the water getting too low, or the pressure of steam too high in a boiler.

Claim.—The arrangement of the hollow water alarm valve *L* and its seat *k* and passages *n l m*, in combination with the chambers *C* and *D* and steam alarm valve *k*, substantially as described, to form separate means of communication with the same whistle, or its equivalent, for the water and steam alarms.

No. 27,365.—HEMAN B. HAMMON, of Bristolville, Ohio.—*Improvement in Hand Corn Planters*.—Patent dated March 6, 1860.—This machine is operated by simply taking it by the handles and striking the point into the ground the proper depth, the sliding front is then drawn up, which causes the lid *D* to open and allow the deposit of seed, then by pushing the sliding front down the lid is closed and the seed pressed into the side of the hill, and at the same time carries a charge of seed from the seed chamber ready for the next hill.

Claim.—The arrangement of the seed box *A*, sliding front *B*, back *C*, lid *D*, mouthpiece *E*, handles *F* and *G*, gauge *e*, set screw *n*, clasps *a¹ a² a³ a⁴*, the crooked finger *9*, branch *7*, pins *X X*, the flaring mouth *f*, channel *t*, measuring cavity *i*, brush *r*, for joint operation, as described, for the purpose specified.

No. 27,366.—A. B. JOHNSON, of Washington, Ia.—*Improvement in Horse Hay Rakes*.—Patent dated March 6, 1860.—This invention consists in the employment of a double rake, hung upon a suitable frame or arms which are to be secured to the wheels and axle of a wagon, and capable of turning in its bearings in said frame.

Claim.—The combination of the lever *J*, pawl *K*, wheels *I* and *H*, and stop pawl *L*, in combination with a double rake, arranged and operating in the manner set forth.

No. 27,367.—JASPER JOHNSON, of Geneseo, N. Y.—*Improved Gate*.—Patent dated March 6, 1860.—The turning of the pulley *p* raises and lowers the rod *R*, between the guides *a a¹*, and by the pressure of said rod against the guides in this movement causes the gate to turn upon its hinges and open or close as the case may be.

Claim.—The combination of rod *R*, guides *a a¹*, pulley *p*, and weighted cords *c*, with the gate and posts arranged and operating substantially as described.

No. 27,368.—DANIEL KAUFMAN, of Boiling Spring, Pa.—*Improvement in Hog Elevators*.—Patent dated March 6, 1860.—On the top of the post or upright *A*, there is secured a revolving cap *C*, and to this cap two short uprights *b b* are attached, which have a shaft *c* fitted between them. On this shaft *c* a lever *D* is placed, the former serving as a fulcrum for the latter.

Claim.—The post or upright *A*, provided with the radial bars *a*, in connection with the revolving cap *C*, with lever *D* attached, the whole being arranged, as shown, to form a new and useful device, for the purpose specified.

No. 27,369.—GEORGE W. KEENE, of Lynn, Mass.—*Improvement in Boot and Shoe Heels*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Uniting the top lift *f* of a boot or shoe heel to the body *A* of said heel by means of an interposed metal plate *c*, having points or projections on both of its sides, which enter the top lift and the body of the heel, and thus secure itself to the top lift and the body of the heel, and each to the other, substantially as described, for the purpose specified.

No. 27,370.—JAMES W. LYON, of Brooklyn, N. Y.—*Improved Machine for Finishing Plugs of Stopcocks*.—Patent dated March 6, 1860.—A detailed description of this invention would require too much space to be given here. The claim and engravings will give an idea of the nature of the invention.

The inventor says: I *claim*, first, constructing the main bearing surface of a lathe spindle entirely of sharp W grooves, substantially as described.

Second. In combination with a lathe spindle and belt shipper, the friction brake B⁴, substantially as described.

Third. In combination with the chuck, the pins C⁶, slots C⁷, and adjusting screws C⁸, substantially as described.

Fourth. The arrangement, in combination with the machine, of the sliding carriage D, substantially as described.

Fifth. The arrangement, in combination with the machine, of the system of levers F¹ F², in connection with the treadle and reacting spring, substantially as described.

Sixth. The arrangement of the parallel mandrils G⁴ G⁵, in combination with the spindle and chuck, and carrying a cutting and tapping tool, substantially as described.

Seventh. The arrangement and mode of adjusting the different parts of the cutting tool H, substantially as described.

Eighth. The two slide rests I² I³, in combination with each other and with the machine, substantially as described, and substantially for the purposes set forth.

Ninth. In combination with the spindle, brake, and lever, operating the belt shipper, the arrangement of the vibrating arm and rotating cutters, substantially as described.

Tenth. The combination of the vibrating arm with the sliding carriage.

Eleventh. The hinged hand rest, in combination with the spindle and bed A, substantially as described.

Twelfth. The combination of the hinged hand rest with the sliding carriage and treadle lever, substantially as described.

Thirteenth. The arrangement of the internal mandrel and drill, in combination with the spindle and chuck, substantially as described.

Fourteenth. The combination of the internal mandrel and drill with the black slide rest, substantially as described.

Fifteenth. And finally, I *claim*, in connection with a spindle and chuck suitable for holding the cast plug, and so arranged with relation to the motive power as to be rotated in reverse directions or be held firmly in a fixed position, the cutting tool H and tap, the cutting tools I I¹, and the vibrating rotating cutter or cutters, or their equivalents, when arranged substantially as described, so as to successively perform their respective parts of the operation of finishing the plug without removing it from the chuck and to repeat their operations upon each successive plug, substantially as described.

No. 27,371.—JOHN MAGEE, of Lawrence, Mass.—*Improvement in Coffee Pots*.—Patent dated March 6, 1860.—In the drawings, E is a thumb lever, with a fulcrum H, by the use of which the piston F is moved up and down in a cylinder open at both ends K O, with two openings L N in the side next to the nose of the tea pot; the spring P is to draw the piston down and to keep the cylinder closed at the lower end, at all times, except when the thumb power is applied to the lever E.

Claim.—The use of the piston F and openings in cylinder, as applied to tea and coffee pots, for the purposes described.

No. 27,372.—EDWARD MATTOCKS, of Lyndon, Vt.—*Improved Shutter Operator*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described application of the lever U to the lever or bar C, and its arrangement with reference to the sectoral gear E and the pinion G, whereby, by the revolution of the said pinion, the blind may be not only either opened or closed, but latched or unlatched, in manner as set forth.

No. 27,373.—HAZAEI MAYHEW, JR., and ENOCH MAYHEW, of Lancaster, Pa.—*Improvement in Preparing Coal*.—Patent dated March 6, 1860.—This invention consists in the manner of preparing coal by the use of an air tight coal bin, in which coal is boiled or steamed, by being attached to an ordinary steam boiler having a steam pipe extending through a fire into the coal bin, so that coal can be made of a better quality by thus bringing it into contact with hydrogen.

Claim.—Making coal better in quality by bringing it into contact with hydrogen, by the mode and manner specified.

No. 27,374.—JAMES D. MOORE, of Zanesville, Ohio.—*Improvement in Self Loading Fire Arms*.—Patent dated March 6, 1860.—This invention consists in the manner of arranging the magazines in relation to the barrel or chamber of the gun, so that the chamber may receive its loose powder and ball charge, convey it into the proper position for discharging the piece, and cutting off the fire of the discharge from the magazine of the powder, to prevent it from igniting or exploding.

The inventor says: I *claim*, in combination with a carrying and cut-off plate C, the mova-

ble and stationary magazines *a b*, for containing loose powder and balls or short cartridges, and operating together substantially as described.

I also claim, in combination with a semi-rotating breech piece *H*, the plate *C* and magazines *a b*, substantially as described.

I also claim the combination of the cam plate *G* and lever *I*, for actuating the slide plate *C* at proper intervals, as set forth.

I also claim so connecting the dog with the bolt *c* as that the hammer will not catch or stand at full cock, unless the bolt is in its proper position to lock the breech and barrel in line, substantially as described.

No. 27,375.—CHARLES GUSTAVE MUELLER, of New York, N. Y.—*Composition for Extinguishing Fires*.—Patent dated March 6, 1860.—This invention is to produce a composition which, by the quantity of non-combustible gases emanating from it when lighted, will serve to extinguish fires in rooms which are partially or entirely closed.

Claim.—The described composition of charcoal, sulphur, nitre, sugar, and red lead, mixed together in the proportions specified, for the purpose of extinguishing fires.

No. 27,376.—JIMPSEY B. NETHERLAND, near Louisville, Ga.—*Improvement in Cultivators*.—Patent dated March 6, 1860.—The lower extremities of the standards *B C* have points entering recesses of corresponding size and shape in the rear sides of the shovels or ploughs which are attached to them. The upper extremities of the standards are provided with two or more bolt holes, for the purpose of adjusting their position according to the character of the work to be done.

Claim.—The arrangement of the peculiarly shaped branched standards *B C*, constructed as described, in combination with blades or shovels, constructed as described, and attached to the standards in the manner specified.

No. 27,377.—DAVID NEWBROUGH, of Clarksburgh, Ind.—*Improved Churn*.—Patent dated March 6, 1860.—The cream being placed in the barrel *A*, the operator takes hold of the handle *O* and elevates that end to an angle of forty degrees, the barrel bearing its weight upon the frame *E* at the point *D*; then drops the elevated end so as to raise the other to an equal altitude. This motion is repeated in quick succession until the process of churning is completed.

Claim.—A churn, constructed substantially as described and specified, that is to say, with a cream receptacle *A*, brakes *F* and *H*, with gatherer *Q*, when these several parts are constructed and arranged for operation conjointly as and for the purposes described.

No. 27,378.—JOHN J. PAXSON, of Middletown, Ind.—*Improvement in Cultivators*.—Patent dated March 6, 1860.—This invention consists in attaching to a cultivator frame a seed distributing device, composed of a reciprocating slide fitted within a suitable seed box, provided with a cut-off, and operated by cranks and connecting rods from the shaft of a driving roller which is fitted to an elastic adjustable frame attached to the cultivator frame.

Claim.—The attaching of the roller or wheel *F* to an elastic frame *C* connected to the cultivator frame *A* by a bolt *h*, and communicating motion to the slide *F* from the shaft or axle *D* by means of cranks *l l* and connecting rods *m m*, attached to the ends of the pivotted bar *n* on the slide *F*, the whole being arranged as and for the purpose set forth.

No. 27,379.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Seeding Machines*.—Patent dated March 6, 1860.—In each of the hoppers *J* and *I* a false bottom *D D¹* is placed, closely upon the partitions *F*; in each of these false bottoms, holes are cut at *T T¹*, over the wheels *B* and *O*, to correspond with the holes *u* and *n*; upon one end of the stops *e* and *f*, chain pulleys *d d¹* are fixed, driven by means of a chain *P* leading from the wheel *b* upon the main axle *c*.

Claim.—The arrangement of the hoppers *J* and *I*, compartments *R*, partitions *F*, the false bottoms *D* and *D¹*, shafts *E* and *F*, feeding wheels *B* and *O*, all constructed and operated as described.

No. 27,380.—GEORGE W. PHENIX, of New Brunswick, N. J.—*Improved Washing Machine*.—Patent dated March 6, 1860.—This invention consists in providing inclined planes at the top and bottom upon the rollers attached by a ledge to the outside washboard to rest and travel, which said rollers travel up the inclined planes and are forced apart by the clothes, arranged in the usual way in the centre washboard and dasher, and come together again by the gravity of their own weight and the force of the springs in their travel down the planes.

Claim.—The inclined planes *J J J J*, spiral springs *n n*, with the rollers and washboards to produce friction in washing, and in combination with levers or treadles *m m*, as and for the purposes described.

No. 27,381.—JOHN T. PLASS, of New York, N. Y.—*Improvement in Slide Valves of Steam Engines*.—Patent dated March 6, 1860.—This invention consists in the employment of a follower fitted to a stuffing box in the back of the steam chest, and held against the back of the valve by a set screw, with an interposed spring, in such manner as to prevent the action of the steam on the back of the valve to a greater extent than may be desired.

The inventor says: I *claim*, first, the arrangement, in connection with the follower C, of the cup *f*, spring G, gland E, and exterior adjusting screw *f*, as and for the purpose shown and described.

Second. The combination of the stuffing box D with the follower C and gland E, as and for the purpose shown and described.

Third. The combination of the openings *h h* in the follower C, with the openings *i i* in the gland E, as shown, so that any steam which escapes under the force of the valve, will find exit to the atmosphere, and thus notify the attendant of the leakage and enable him to regulate the adjustment of the valve accordingly.

No. 27,382.—HUNTINGTON PORTER, of Cummington, N. H.—*Improvement in Hoes*.—Patent dated March 6, 1860.—A is a curved portion of the hoe, which is continued out by two wings B B, terminating in sharp points; the socket C for attaching the hoe to the handle is on top of the hoe and between the two wings B B.

Claim.—The arrangement of the peculiarly curved and pointed wings B, socket C, and round blade A, as and for the purposes shown and described.

No. 27,383.—ROBERT PRICE, of New York, N. Y.—*Improved Combination of Mop and Scrubber*.—Patent dated March 6, 1860.—This invention consists in constructing a mop and scrubber in such a manner so as to attach the mop and brush to the same handle and detach either at pleasure, to enable the mop to be wrung without touching it with the hands.

Claim.—Constructing the handle A and cloth frame D in such a manner, as described, so as to attach to said handle and frame a scrubbing brush and to the wringing rod a mopcloth, for purposes specified, or any other construction substantially the same, or effecting the same facilities to accomplish the same end.

No. 27,384.—GEORGE W. RAINS, of Newburgh, N. Y.—*Improvement in Slide Valves of Steam Engines*.—Patent dated March 6, 1860.—This invention consists in the manner of supporting the slide valve or valves of a steam engine by means of a carriage running on rollers upon the valve seat, or on a face parallel therewith, whereby the valve is relieved of unnecessary pressure and friction.

Claim.—The combination of the suspended valve A A¹ with the carriage B, and rollers *c*, as and for the purpose shown and described.

No. 27,385.—JOHN R. ROGERS, of Sacramento, Cal.—*Improvement in Centrifugal Seeding Machines*.—Patent dated March 6, 1860.—In using this machine, the operator moves the slide *c*, by the lever I, and the rod J, so as to allow a sufficient quantity of grain to fall through upon the wheel F, and walking forward gives the rod H a backward and forward motion at each step, the grain falling upon the wheel F is thrown off violently, and distributed over the ground.

The inventor says: I *claim*, first, the arrangement of the rod H and the cord *a*, in connection with the shaft E and wheel F, the same being used in the manner and for the purpose specified.

Second. I also claim the arrangement of the shaft E with the slotted seed slide C, shaker *c*, lever I, and rod J, in the manner and for the purpose set forth.

No. 27,386.—SAMUEL P. RUFF, of Weaver's Old Stand, Pa.—*Improvement in Mill Spindles*.—Patent dated March 6, 1860.—This invention consists in arranging the vertical shafts of mills, water wheels, &c., so that all their points of bearing shall come in contact with rolling or anti-friction surfaces.

Claim.—The arrangement, consisting of a vertical shaft C *h i j*, grooved plates or blocks *c d B w v*, friction roller frames D E F *o*, friction rollers *l m n*, and axial pin *g*, the whole constructed and used together in the manner and for the purpose described.

No. 27,387.—MARK RUNKEL, of New York, N. Y.—*Improvement in Oscillating Steam Engines*.—Patent dated March 6, 1860.—This invention consists in arranging a cylindrical piston, with two projections, in a cylindrical shell, or cylinder with two abutments *a a*, and furnished with four ports *c c¹ c c¹*, two on each side, which are governed by two slide valves I, operated from the same eccentric, so that the steam acts on the piston C¹ simultaneously on both sides, thus giving the double power, and balancing the pressure on the shaft or piston rod C.

Claim.—The arrangement of the oscillating cylindrical piston C¹, or its equivalent, in com-

bination with the stationary cylinder A, or its equivalent, constructed and operating substantially in the manner and for the purpose specified.

No. 27,388.—THADDEUS S. SCOVILLE, of New York, N. Y.—*Improvement in Cultivators*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and combination of the side beams A A hinged together, the jointed bar *a* connecting the thills, the spur wheels D D D D, acting both as cultivators and supporters, the convertible cultivating teeth E E, and the sliding or self-adjusting seat G, substantially in the manner and for the purpose specified.

No. 27,389.—JOHN ADAM SCHEUTZ, of St. Louis, Mo.—*Improvement in Anti-rheumatic Liniments*.—Patent dated March 6, 1860.—The inventor says: Take one half of an ounce of the spirits of turpentine, one half of an ounce of the spirits of hartshorn, one fourth of an ounce of formic acid, one quarter of an ounce of stone oil, one quarter of an ounce of lard oil, one quarter of an ounce of fir nut oil, and mix them well together, and apply the mixture externally to the parts affected.

Claim.—The compound composed of the afore mentioned ingredients.

No. 27,390.—JAMES SELBY, of Peoria, Ill.—*Improvement in Seed Drills*—Patent dated March 6, 1860.—The shaft B has its bearings in either end of the seed box, and is provided with serrated wheels C, which revolve into or through the discharge openings in the bottom of the seed box. The wheel C is provided with a series of radial cavities *a* on one side, and a flange *b* on the opposite side. The sliding valve *f* is operated by the cam E, to close and uncloze the discharge opening *c*.

Claim.—The arrangement of the shaft B, serrated wheel C, slide *f*, bar F, and cam lever E, when the same are used substantially as and for the purpose specified.

No. 27,391.—HAMILTON E. SMITH, of Philadelphia, Pa.—*Improved Washing Machine*.—Patent dated March 6, 1860.—The pounding of the inner reel or roller C on the clothes has the effect of forcing the water contained in the folds through the interstices of the fabric, and through perforations between the slats of the revolving reel into the outer vessel or reservoir, and the latter may serve as a receptacle for the heavy particles of dirt which are thus prevented from returning to the folds.

The inventor says: I *claim* the slotted or perforated reel C, having any convenient number of straight sides when the said reel is arranged to revolve within the water contained in the outer vessel A, and when it operates in conjunction with the weighted reel or roller D, as and for the purposes set forth.

I also claim the heater P, with the coiled pipe F, or its equivalent, when combined with the outer casing A, and the reels C and D, in the manner and for the purpose specified.

No. 27,392.—GEORGE K. SNOW, of Watertown, Mass.—*Machine for Folding and Pasting Paper*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a machine or combination consisting not only of mechanism for producing a single folding of a sheet of paper, but mechanism which shall operate to produce either one or two further and parallel folds or turns of such paper in an opposite direction, substantially as specified; such mechanism, as shown in the drawings, being the plates G H C D and E, arranged and made to operate together essentially in the manner and by means as hereinbefore set forth.

And I also claim a combination consisting not only of mechanism for folding a sheet of paper once, and mechanism for producing one or more further parallel folds or turns of the sheet in an opposite direction, but mechanism which shall operate to produce either one, two, or three folds of the sheet at a right or other angle with the line or lines of previous foldings of it; such combination of mechanism as exhibited in the drawings being the plates G H C D C¹ D¹ E N O and R, operated in the manner and by means substantially as heretofore described.

I also claim a combination or machine consisting not only of mechanism for folding a sheet of paper one or more times, but mechanism for applying paste or cement on such part or parts of the sheet as may be required, in order to cause the sheet to stick together at any two or more of its folds or lines of fold; the mechanism shown in the drawings for applying paste being the paste roller *s*², paste fountain *t*², and the wheel *y*², arranged and operated relatively to the platform B and the folding plates, substantially as explained.

And in combination with the receiving trough or spout S and the sheet abutment U, I claim the mechanism or frame W for receiving the sheet from the abutment and conveying it toward, and pressing it upon, either the pack or packholder that may be within the trough S.

And in connection with the receiving and conveying apparatus or frame W, applied to the

trough S and its abutment U, as described, I claim the application to the abutment of a carriage V, and a hand lever Z, or any equivalent mechanism by which such abutment may be moved in a direction away from the sheet receiver, so as to enable the latter to expel from the machine an imperfect sheet, or an imperfectly folded sheet, essentially as specified.

I also claim the arrangement and combination, in the manner described, of the adjustable stop bar o^2 , with the two folding plates G H, and the plate E, to run between them.

I also claim, in combination with a paper-folding machine, constructed so as to fold paper or fold and apply paste to it, substantially as described, a heating apparatus so applied as to heat a pack of folded paper while in the machine, the same being to facilitate the desiccation of the pack or paste applied thereto, for the purpose set forth.

I also claim, in a paper-folding machine, the combination of the lifter bar g^2 with the register points f^2 , applied to the platform upon which the sheet to be folded is placed.

And I also claim the combination of the slotted plate or bearer h^3 , or its equivalent, with a folding plate and a pasting apparatus of the paper-folding machine; the same being to prevent a pasted part of a sheet from adhering to the outer surface of the folding plate.

No. 27,393.—C. M. SPENCER, of South Manchester, Conn.—*Improvement in Self-Loading Fire Arms*.—Patent dated March 6, 1860.—This invention consists in an improved mode of locking the movable breech of a breech loading fire arm, whereby it is easily opened and closed, and very firmly secured in place during the explosion of the charge; and also in certain contrivances operating in combination with the movable breech, for the purpose of withdrawing the cases of the exploded cartridges from the chamber of the barrel and for conducting new cartridges thereinto from a magazine in the stock.

The inventor says: I claim, first, the combination of the rolling breech E, the lever G, and sliding locking bolt F, the whole fitted and applied substantially as set forth.

Second. The slide H, applied to the rolling breech and operating in combination with the hammer, substantially as and for the purpose specified.

Third. The combination of the serrated projection $n m$, the rolling breech, and the tongue J, applied and operating substantially as described within the opening in the breech supporter.

No. 27,394.—THOMAS STEWART, of Philadelphia, Pa.—*Improvement in Slide Valves of Steam Engines*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The elastic or yielding diaphragm I, attached to the balance frame H, and to the steam chest, and arranged in the manner set forth, when the said diaphragm has such an extent of its upper surface exposed to the pressure of steam that while the latter maintains the balance frame in close steam tight contact with the valve, the said valve is relieved in a great measure from the pressure of steam, as specified.

No. 27,395.—GRAY UTLEY, of Chapel Hill, N. C.—*Improved Head Rest for Travellers in Railroad Cars, Carriages, &c.*—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The rest H, supported by the shoulders of the wearer and having terminations for supporting the wearer's arms, so that the weight thereof shall counteract the pressure of the head against the said rest, substantially as set forth.

No. 27,396.—AARON C. VAUGHN, of Johnstown, Pa.—*Improved Churn Dasher*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the shafts of a series of revolving churn dashers B, C, D, longitudinally in the churn box A, and connecting them by means of cogged wheels or other mechanical equivalents, when the latter are arranged inside of the churn box and rotate each adjacent pair of dashers in contrary directions, as shown, and when the blades of the dashers in each series incline in contrary directions also, substantially in the manner and for the purposes described.

No. 27,397.—AARON C. VAUGHN, of Rainsburg, Pa.—*Improved Mortising Machine*.—Patent dated March 6, 1860.—This invention consists in cutting square or oblong mortises by the use of two hinged cutters m , that work towards each other, when cutting, and from each other, as they are raised or drawn back for each succeeding cut.

Claim.—Two nipper jaw cutters constructed and operating substantially as described, for the purpose of cutting a square or oblong mortise in the wood; and this I claim whether the cutters be operated or fed up to their work by the mechanical contrivances represented or by any others substantially the same.

No. 27,398.—NICHOLAS S. VEDDER, of Troy, N. Y.—*Improvement in Cooking Stoves*.—Patent dated March 6, 1860.—This invention consists in the arrangement of smoke flues

from the fire box B, along the top plate C, end plate or end plates $d d^1$, and bottom plate e , of the oven A, so as to heat the oven suitably for baking and roasting purposes, and at the same time having the door or doors $f f^1$ of the oven placed in the side or sides $g g^1$, directly opposite to the upright side or sides $h h^1$ of the fire box, in order that perfectly free and direct access may thereby be had to the highest and most roomy and useful part i of the oven.

Claim.—The arrangement of the door or doors $f f^1$ of the oven A, directly opposite to the side or sides $h h^1$ of the fire box, and of the most capacious and effective portion of the oven, as and for the purpose set forth, the smoke flues being extended from the fire box along the top c , end or ends $d d^1$, and bottom e of the oven, substantially as described.

No. 27,399.—J. M. WAMPLER, of Loudon County, Va.—*Improvement in Breech Loading Fire Arms.*—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the double catch X and K, which holds down the breech and at the same time holds the rear end of the trigger guard, both being relieved by one pressure of the finger in the act of pulling down the guard to raise the breech for loading,

Second. The peculiar construction set forth whereby the percussion bar N is forced back and locked to a short half cock or safety catch I, sufficiently far to clear the cap, cartridge, or breech, this being done by the same pressure of the finger that frees the double catch and the trigger guard.

Third. The rock lever P, for freeing the percussion bar from its half cock at the instant of full cocking.

Fourth. The back sight Y, constructed and operated as described, for the purpose specified.

No. 27,400.—HENRY WATERMAN, of Haverhill, Mass.—*Improved Apparatus for Hoisting Water.*—Patent dated March 6, 1860.—This invention consists in combining, with a self-discharging bucket, a circular trough placed around the well curb, into which the bucket may discharge when raised to a sufficient height.

Claim.—The trough D, around the well curb, in combination with the self-discharging bucket H, when operated substantially as set forth.

No. 27,401.—E. D. WILLIAMS, of Philadelphia, Pa.—*Improvement in Solidified Fuel from Coal Dust.*—Patent dated March 6, 1860.—The claim will explain the nature of this invention.

Claim.—Compounding and preparing a solidified fuel from coal dust, peat, and other like substances, by mixing the same with glutinous paste, subjecting the composition to pressure in moulds, and subsequently drying the condensed blocks, as set forth.

No. 27,402.—F. O. WILSON, of Mount Olive, N. C.—*Improvement in Cultivators.*—Patent dated March 6, 1860.—As the two side ploughs loosen the earth at the roots of the corn or cotton, and destroy the weeds or grass, the double mould turn plough advances and fills up the furrows created and leaves a shallow furrow in the centre of the two rows.

Claim.—The double mould turn plough F, and the side turn ploughs H H, in combination with the beam A, middle stock E, cross frame D, and side stocks G G, when said beam A and middle stock E shall be braced and supported by the stay C, and the other parts constructed and arranged substantially as and for the purpose specified.

No. 27,403.—JOSEPH WOODRUFF, of Rahway, N. J.—*Improved Steam and Fire Regulator.*—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the disks or diaphragms B and C, connected together so as to form a double diaphragm, constructed and operating substantially as set forth.

Second. The clamping rings D, when applied to diaphragms, for the purpose of making a steam or air tight joint.

Third. The concave cup or bearing G, for supporting the lower diaphragm, when about the size of the standard or bearing F.

Fourth. The hollow packing screw K, constructed as described, and operating in the manner set forth.

Fifth. The double adjustable clevis and yoke I, in combination with the standard F and lever H.

No. 27,404.—AUSTIN WOODFOLK, of Parish of Iberville, La.—*Improvement in Ditching Machines.*—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the combination of the inclined excavator with an adjust-

able throat plate, or its equivalent, so arranged as to prevent the earth from breaking and deliver it in a sheet to the carrying band.

Second. In combination with the excavator, I claim the adjustable sloper jointed to the side of the excavating plough, substantially as described for the purpose set forth.

Third. In combination with the inclined excavator, I claim the continuous carrying band *G*, arranged across the end of the inclined plane and extending outside the same and at right angles thereto, to receive the earth, substantially as described.

Fourth. Arranging the joint pivot of the frame of the continuous carrying band extending across the end of the excavator, substantially as described, so as to prevent the inclination of the band being changed at the rear of the inclined excavator, when the inclination of the band is varied outside of the frame of the excavator.

Fifth. The combination of a carrying band with a pressure roller *e*, arranged substantially as described, to compress the earth on the band so as to form a continuous sheet, for the purpose set forth.

No. 27,405.—WILLIAM CHADWICK, of Bury, England, assignor to himself and WILLIAM GRIFFITHS, of Philadelphia, Pa.—*Improvement in Ventilators*.—Patent dated March 6, 1860; patented in England May 28, 1858.—*a* is the case to which are fixed the footstep *a*¹ and the bearing *a*¹, supporting the spindle *c*; to this spindle are fixed the vanes or worm *b* and the hood *i*, of the usual construction, having vanes and perforations.

Claim.—The combination of the spiral vanes or worms *d* with the screw vanes *b*, standard *c*, and case *a*, when the same are arranged without any partition between the vanes *d* and *b*, and without any casing around the vanes *d*, but in the manner and for the purpose specified.

No. 27,406.—ROBERT CRAIG, of State Line City, Ind., assignor to himself and J. D. LUDLOW, of said State Line City.—*Improvement in Cultivators*.—Patent dated March 6, 1860.—This invention consists in the employment of bevel keys, interposed between the feet of the implement and the shares, for the purpose of adjusting the latter in oblique positions to the right or left, so as to throw the earth outward from the implement or inward toward its centre, as circumstances may require.

Claim.—The employment or use of the curved bevel keys *F*, interposed between the shares and their feet, and secured by the same bolts *d* which attach the shares to the feet, as and for the purpose specified.

No. 27,407.—HENRY EASTMAN, of Indianapolis, Ind., assignor to D. HENDERSON, of said Indianapolis.—*Improvement in Horse Hay Rakes*.—Patent dated March 6, 1860.—In the drawings, *A* represents a series of heads, in which the teeth *P* are secured and fastened. To the under side of the axle *C* the three pieces *D*¹ *D*² *D*³ are hung by the use of hinges. To the platform *E* is attached the lever *B*, having the arm *F* extending forward at right angles with the lever, having the roller *G* fastened in the slotted end and working on the piece *D*¹, which is hung at right angles to the piece *D*³.

Claim.—The arrangement of the toothed rake heads *A* *P*, triangular frame *D*¹ *D*² *D*³, axle *C*, hand lever *B*, arm *F*, friction roller *G*, and catch *H*, substantially in the manner and for the purpose described.

No. 27,408.—W. A. FLANDERS, of Cleveland, Ohio, assignor to himself and T. W. BOYCE, of said Cleveland.—*Improvement in Bee Hives*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the combination of the triangular reversible comb frame or comb frames *B* *B* and the angular adjustable case or chamber *A*, or their equivalents, arranged substantially in the manner and for the purposes set forth.

Second. I claim the mechanism or means arranged substantially as described, or their equivalents, by which I am enabled to adjust or place the embryo brood contained within the hive or in the frames above or nearly above the feeding swarm, in the manner and for the purposes specified.

Third. I claim the improvement in the comb guide, consisting of the wire saddle *D*, hooks *D*¹, and glass plate *D*², or their equivalents, constructed and applied in the manner and for the purposes specified.

Fourth. As an improvement in moth traps, I claim the hinged wings *O* *O*, in combination with the central inclined plane *N*, the several parts being constructed and arranged in the manner described, for the purposes set forth.

Fifth. I claim the drone separator *H*, provided with the passages *J* *J*, when used in combination with the wings *I* *I*, substantially as set forth, for the purposes specified.

No. 27,409.—GEORGE H. HORN, of Boston, Mass., assignor to himself and EDWIN B. HORN, of said Boston.—*Improvement in the Needle Holders of Sewing Machines*.—Patent dated March 6, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* my improved device or mechanism for holding and adjusting the needle, it being composed of the secondary socketed holder B and its ball e^1 and supporting socket, applied to the needle carrier, and having a device or devices for clamping the ball to the carrier, substantially as specified.

And in such I also claim making the ball needle holder with the split or slit in its ball, substantially as described, and so as to coöperate with the clamping screw or device, and cause it to clamp both the needle and the needle holder at one and the same time, as described.

No. 27,410.—GIBBONS L. KELTY, of New York, N. Y., and THOMAS G. HAROLD, of Brooklyn, N. Y., assignors to RICHARD H. KELTY, of New York city.—*Improved Curtain Fixture*.—Patent dated March 6, 1860.—The nature of this invention will be understood by the claim and engravings.

The inventors say: We *claim*, first, a head or centre pin d , on which the roller revolves, combined with the metallic bracket c , substantially as specified, whereby the roller is prevented from becoming disconnected by end motion to the roller or looseness of the bracket, as set forth.

Second. We claim the combination of the centre pin, provided with a head, with the spring g , that acts to draw the head of the centre pin to the bracket, as set forth.

Third. We claim confining the blind cord by means of two flat or nearly flat surfaces that are pressed towards each other by means of a spring, when one of those flat or nearly flat surfaces is stationary and the other is attached to the shade or curtain roller, whereby the said roller can be revolved or will remain in any position to which it may be turned, as specified.

No. 27,411.—WALTER J. F. LIDDELL, of Erie, Pa., assignor to himself and BENJAMIN HERSHEY, of said Erie.—*Improvement in Car Springs*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So connecting or suspending the yielding part of a car or carriage to the unyielding part thereof, by springs arranged vertically, as that the weight or force applied thereto shall elongate or extend said springs longitudinally, or in the direction of the applied force, and their removal allow the said springs to contract in that direction, substantially as described.

No. 27,412.—ALVIN R. PAINE, of New York, N. Y., assignor to JOHN M. MYERS, of said New York.—*Improvement in Sewing Machines*.—Patent dated March 6, 1860.—This invention consists of two clamping segments set within a rim or hub on the feed wheel, and acted on by a cam movement at the centre of the feed wheel in such a manner that the said feed wheel receives a motion due to the vibration of the lever carrying said cam.

The inventor says: I *claim*, first, the clamping segments $g g$ within the ring 1 of the feeding wheel, when said segments are formed with the flat side or removed portion at 2 2, for the purposes and as specified.

Second. I claim the combination of the vibrating lever h and segments $g g$, when the segments are formed with the cam shaped openings 3 3 at their centres, acted on by the block of the lever, in the manner and for the purposes specified.

No. 27,413.—SEPTIMUS C. STOKES, of Manchester, N. H., assignor to himself and BENJAMIN S. STOKES, of said Manchester.—*Improved Knife Sharpener*.—Patent dated March 6, 1860.—Between the two bars A B are arranged two guides F G, for properly guiding and supporting a knife while it is sharpened. They should be arranged apart from each other, as shown at a , each being made angular on its inner surface.

The inventor says: I *claim* the combination and arrangement of two cylindrical or other files or bars A B with a frame or holder C and a clamp, substantially as and for the purpose described.

And, in combination with the two rods or bars A and B and a frame or holder C, arranged with respect to each other substantially as specified, I claim the gauges or guides F G, arranged relatively to the said bars, essentially in manner and for the purpose as set forth.

I also claim the combination and arrangement of the projecting rest D with the two crossed bars A B and their holder C, provided with a handle, as specified.

No. 27,414.—HENRY WIGHT, of Cambridge, Mass., assignor to WILLIAM C. McCLORLAND, of Springfield, Mass.—*Improvement in Wooden Soled Shoes*.—Patent dated March 6, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The new manufacture of boot or shoe described, viz: a boot or shoe with a wooden sole, having the tops or upper fastened to the sole in a proper manner by pegs, nails, or screws passing through a portion of the wood of the sole and through the upper or edge of the top and into the wood work of the sole again, substantially as set forth.

No. 27,415.—**ETHAN ALLEN**, of Worcester, Mass.—*Improvement in Constructing Fire Arms*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making or forming notches or catches on cylinders of fire arms or other work, by pressing or cutting, or both, in the manner and for the purposes as set forth and described.

No. 27,416.—**EDWARD ANDREWS** and **JOHN H. CARR**, of Palo Alto, Pa.—*Improvement in Lubricating Journals*.—Patent dated March 13, 1860.—This invention consists in forming an air tight chamber to contain the lubricating material in the shaft or journal, the lubricating material being supplied to the bearings of the journals or shafts through a hole communicating from the air tight chamber to the outer surface or circumference of journals or shafts.

Claim.—The combination and arrangement of the air tight chamber A, tube B, valve C, spring H, and piston D, with small hole E, constructed and operated substantially as described.

No. 27,417.—**PETER BAILEY**, of Falls Township, Pa.—*Improvement in Grain Fans*.—Patent dated March 13, 1860.—This invention consists of certain coupled rods jointed to the stationary frame and to the shaker of an ordinary grain fan, arranged in respect to the sieve and to the inclined plane down which the grain and chaff pass to the sieve, and operating so as to agitate the grain and chaff as it falls from the inclined plane, and insuring such a thorough exposure of the chaff to the current of air as will facilitate its separation from the grain.

Claim.—The coupled rods D and G, and D¹ and G¹, jointed to the frame A and to the shaker B, arranged in respect to the inclined plane *b* and sieve *d*, and operating substantially as set forth.

No. 27,418.—**JOHN BALLOU**, of Cincinnati, Ohio.—*Improvement in Adding Machines*.—Patent dated March 13, 1860.—This invention relates to a peculiar construction of rings in which are combined the three features of a finger wheel, ratchet, and register.

Claim.—The construction of the rings C¹ C² C³, marked on their peripheries with numerals, substantially as and for the purposes set forth.

No. 27,419.—**JOHN W. BARCROFT**, of Friendship, Va.—*Improvement in Ditching Machine*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of buckets or scoops *b*, having hinged falling bottoms *d* with a guard E of such shape that it keeps the bottoms of the buckets from falling until the proper time for discharging the dirt which has been dug or scooped up, and then allows the bottoms to fall, and, after the discharge of dirt has taken place, raises the bottoms to their original position, ready for another digging or scooping operation.

Second. Combining the guard with the frame *a*, which carries the buckets by means of brackets *e* having friction rollers *f* suspended on them, substantially as and for the purposes set forth.

No. 27,420.—**BENJAMIN F. BARKER**, of Belfast, Me., and **ISAAC T. BARKER**, of Montville, Me.—*Improved Machine for Sawing Veneers spirally from the Log*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A traversing carriage carrying the devices, substantially such as are described, for holding and rotating the block and feeding it to the saw, so as to saw it spirally from the periphery in toward the centre, substantially as described.

No. 27,421.—**CURRAN BATTLE**, of Warrenton, Ga.—*Improvement in Cotton Seed Planters*.—Patent dated March 13, 1860.—The engraving is a side view of the machine, showing all its parts; A is the seed box; *c c* the inclined bottom and front of the box; R the frame or bed on which the box rests; H the handles; B the wheels of the planter; N the saw toothed planting or feed wheel; S the toothed cylinder or rake, to keep the seed loose and bring them in front of the saw; P P the two cogged wheels, one on the axle of the planter and the other on the shaft of the toothed cylinder; C the plough to open the trenches; and O the coverer.

Claim.—The arrangement of the frame R, seed box A, wheels B, handles H, bottom *c c*, cog wheels P P, the saw toothed distributing wheel N, the toothed cylinder S, the plough C, and the coverer O, operating conjointly, as described, for the purposes specified.

No. 27,422.—**JOSHUA BILLS**, of Southington, Conn.—*Improved Sausage Machine*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the spiral shaft J passing through the central slots *g* of the heads L, essentially in the manner and for the purposes fully set forth.

I also claim the cutting knife F united solidly to a metal bar G by its being cast thereon,

and forming a cavity H in the bottom of case A to receive the knife, and so position it by the single screw I, essentially in the manner and for the purpose fully set forth.

I also claim the forward end of the stuffer being concave at C², and the feeding end having a portion of its spiral wings removed at B² and inclined planes *m* inserted, essentially in the manner and for the purposes fully set forth.

I also claim the arrangement of the case A, the stuffer X, and its case W, so that both the cutter and stuffer may be operated in the same case, essentially in the manner and for the purposes fully set forth.

No. 27,423.—C. C. BOMBERGER, of West Carlisle, Pa.—*Improved Wind Wheel*.—Patent dated March 13, 1860.—This invention consists in the use of a cam actuated by a lever connected with a suitable governor, the cam being so arranged with slats composing the wings, that the slats will, as the wheel rotates, be closed to a greater or less extent at certain and necessary points of its rotation, in order to effect the desired end.

Claim.—The arrangement and combination, with the slats C, of the vertical connecting bars D, vertically moving cam E, and governing lever F, so that, as the motion of the wheel increases or diminishes, the lever F will correspondingly raise or lower the cam E and thus regulate the speed of the wheel, all as herein shown and described.

No. 27,424.—I. W. BOWERS, of Cincinnati, Ohio.—*Improvement in Railroad Chairs*.—Patent dated March 13, 1860.—This invention relates to the construction of curved lips or flanges of wrought iron railway chairs, by which greater strength is given in proportion to the weight of metal used, a greater surface allowed to bear upon the cross ties, and a better position afforded to the securing spikes.

Claim.—Providing wrought iron railroad chairs with the curved lips or flanges A¹ b, substantially as and for the purposes set forth.

No. 27,425.—C. P. BROCKETT, E. TODD, and JOHN BROCKETT, of New Haven, Conn.—*Composition for Cleaning and Silvering Metals*.—Patent dated March 13, 1860.—The claim explains the nature of this invention.

Claim.—The compound of "silver soap," herein described, consisting of an alkaline solution of silver, soap, carbonate of lime, and alcohol, in about the proportions stated, and for the purposes of cleaning and plating metals, as set forth.

No. 27,426.—ADOLPH BROWN and FELIX BROWN, of New York, N. Y.—*Improvement in Steam Pumps*.—Patent dated March 13, 1860.—The claim and engraving explain the nature of this invention.

The inventors say: We claim, first, connecting together the steam and pump cylinders of steam pumping engines by means of frames or stretchers, which contain the bearings of the crank shaft, constructed and arranged as described, and for the purpose set forth.

Second. The hinged valves constructed as above described, when the same are arranged and used in combination with steam pumping engines, as set forth.

No. 27,427.—WALTER R. BUSH, of Albany, N. Y.—*Improvement in Wheel and Dress Guards for Carriages*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the attachment to the door of a carriage of a sliding guard, substantially as set forth.

Second. The method of operating such guard by means of a pulley containing a helix spring to raise the guard and maintain it in place, the spring being relaxed by an attachment from the pulleys to the body of the carriage, or by such lever and spring arrangements as are a mechanical equivalent for the same, substantially as set forth in the above specification.

No. 27,428.—JOHN W. COCHRAN, of New York, N. Y.—*Improvement in Cartridge for Fire Arms*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment within the cartridge of two distinct charges of powder, substantially as shown and described, so that one of said charges will explode and start the projectile before the other charge is ignited, all as specified.

No. 27,429.—J. W. CONWAY, of Franklin, Ia.—*Improvement in Cotton and Hay Presses*.—Patent dated March 13, 1860.—When the head B is drawn back and the box filled with material to be pressed, it does not require so much power to press as it does when the material is in a more compact form. The cords *a a* consequently lie around the large ends of the pulleys I I, when the head B begins to move and press the material; said head has also more motion at this time than any other, but, as the head presses the material in, the cords

pass around the small end of the pulleys, thus increasing the power and decreasing the motion of the head.

Claim.—The employment of the screw F, the toothed wheel H, the conical pulleys I I and J, and the cords *a a* and *c*, when the same are arranged together and used in connection with the moving press head B, substantially as and for the purpose set forth.

No. 27,430.—JOHN CHANTRELL, of Bristol, Conn.—*Improvement in Knitting Machines.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, so applying a series of sinkers in a ribbed knitting machine that they work between the two series of needles simultaneously, substantially as described.

Second. The arrangement, in combination with a series of sliding sinkers, of a series of bearded needles *a a*, and a series of latch needles *i i*, arranged obliquely in opposite directions to a line perpendicular to the sliding movement of the sinkers, as illustrated in Fig. 1, and herein described.

Third. The series of plates *t t*, applied, substantially as described, relatively to the two series of needles, to support the last completed course of rib loops against the action of the rib needles in forming the new course.

No. 27,431.—ADDISON CROSBY, of Fredonia, N. Y.—*Improvement in Induction Valve Gear for Steam Engines.*—Patent dated May 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, combining the reciprocating rod G, with the stems or shafts *a a*¹, by means of dogs F F¹, attached to the said stems or shafts, and catch bars M M¹, or their equivalents, attached to the said rod, when the said catch bars or equivalents are so constructed and applied to the said rod, and so controlled as to liberate the dogs during the stroke of the engine by a positive movement away from the said dogs, and transverse to the movement of the reciprocating rod, substantially as described.

Second. Controlling the liberation of the catch bars M M¹, by means of blocks N N¹, or their equivalents, applied to slide on the reciprocating rod I, from which the valves derive their opening movement, substantially as set forth.

Third. Providing for the variation in the lead of the valves by so constructing the catch bars M M¹, attached to the reciprocating rod, as to be capable of being lengthened or shortened, as herein specified.

No. 27,432.—ADDISON CROSBY, of Fredonia, N. Y.—*Improvement in the Eduction Valve Gear of Steam Engines.*—Patent dated March 13, 1860.—This invention consists of a bar, or rod, deriving a regular reciprocating motion from the engine, with the stems of two oscillating eduction valves, or with two rock shafts suitably applied in connection with valves of any other description, by means of arms on the stems or shafts and slotted links attached to the rod to operate in combination with the said arms in such a manner, that the valves are made to open quickly at the commencement of the stroke of the engine, and to remain wide open during nearly the whole stroke, but to close so gradually as to prevent slamming when valves of such construction, as are liable to slam, are used.

Claim.—The combination of the reciprocating rod C, with the stems or shafts *b b*¹ of the valves by means of arms A A¹, and wrists *a a*¹ attached to the said stems or shafts, and slotted links J J¹ attached to the said rod, the whole arranged substantially as herein set forth.

No. 27,433.—WILBUR M. DAVIS, of Carmel, Me.—*Improvement in Shoe Tips.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of such a tip or cap of wire cloth or gauze, or other braided, woven, or netted fabric of wire, whether of copper, brass, or any other metal, and the application of the same to a boot or shoe, sewed, nailed, or pegged or cemented, whether turned or otherwise, for the purpose of protecting the leather or other material of the shoe or boot from injury by wear or ordinary blows.

No. 26,434.—GEORGE DRAPER, of Milford, Mass.—*Improvement in Machinery for Spinning.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the drawing mechanism of a spinning machine, a mechanism which, as the quantity of yarn wound on a bobbin or a spindle of such machine may increase, and the front set of drawing rollers may be moved with a uniform or given speed, shall so decrease the motion of one or more of the remaining sets of drawing rollers relatively to the motion such may have on being started, as to cause the yarn spun and wound around the bobbin to have a uniform size.

No. 27,435.—SPENCER B. DRIGGS, of New York, N. Y.—*Improvement in Pianofortes.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in a pianoforte, of a bridge or bridges of a depth equal to or nearly equal to the whole depth between the strings and the bottom or back of the case, in combination with a single sound board which either constitutes the back of the case or is arranged in the extreme lower or rear part of the same, substantially as described.

Second. The employment, for the purpose of holding the strings at either or each of the bearings or points between which they severally vibrate, of a clamp G, constructed with two jaws, and applied substantially as herein described, so as to be made to bite and clamp the string or strings by the same screw which screws it to the block, plate, or bridge, as set forth.

No. 27,436.—B. WELLS DUNKLEE, of Boston, Mass.—*Improvement in Ranges*.—Patent dated March 13, 1860.—This improvement consists in constructing the lower part of the dividing plate E, in the form of an inverted V, as seen at *c*, the object of which is to conduct the heated volatile products in a close unbroken body upwards, and by making it impinge more closely against the bottom portion of the central side of the oven's surface, so as to add to the heating qualities thereof, fastened also to the bed plate E, so as to entirely prevent the coming together of the volatile products until after they have risen above the V check plate at the top of the dividing plate.

The inventor says: I *claim* the construction and application of the dividing plate E, in the form as above described, in relation to the inducting flues D D, the bed plate F, the check plates *a*, and with respect to the damper K, top check plates *h h*, and ovens *d d*, substantially as and for the purpose set forth.

I also claim the annular *e*, with its openings *m f*, constructed and applied with respect to the damper K, top check plates *h h*, ovens *d d*, and dividing check plates E and *a*, and in relation to two inducting flues D D, substantially and for the purpose above described.

No. 27,437.—JOHN FASIG, of Congress, Ohio.—*Improvement in Pruning Implements*.—Patent dated March 13, 1860.—This invention relates to the combination of the saw, hook, and knife, and uniting them in such a manner as to form an instrument for pruning trees.

Claim.—The combination of an angular cutting edge *b*¹, the double edged saw *a*² *c*, and hook *d*, when all these parts are combined in one instrument, substantially as described, and operating as set forth.

No. 27,438.—WILLIAM FERGUSON and DAVID FERGUSON, of New York, N. Y.—*Improvement in Blackwashing Moulds for Casting*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Blackwashing retort, pipe, or other moulds, by means of the piston D, provided with the hollow rod E, and having felt cloth F or other material around its edges, and brush G combined, or by either the piston and felt cloth or brush separately or equivalent device supplied with the blackwash, and operating as before described.

No. 27,439.—LAWRENCE F. FRAZEE, of New Brunswick, N. J.—*Improvement in Ash Sifters*.—Patent dated March 13, 1860.—The sieve of this sifter is agitated by means of an undulating ring running around the same, and the case is so arranged that the stones and cinders can be separated from the good coal without emptying the sieve.

Claim.—Arranging in the box A a double bottom C, with an aperture I, substantially as and for the purpose specified.

No. 27,440.—DENNIS C. GATELY, of Newtown, Conn.—*Improvement in Elastic Belting*.—Patent dated March 13, 1860.—The claim explains the nature of this invention.

Claim.—The belt or band produced with a friction surface as smooth as it practically can be by grinding or polishing down the rough or unequal surface of the belt, substantially in the manner and for the purposes described.

No. 27,441.—T. J. GIFFORD, of Salem, Mass.—*Improvement in Securing Scaffolding Brackets to Buildings*.—Patent dated March 13, 1860.—This invention consists in constructing the bracket itself in a peculiar manner, and in the use of a screw having a collar and a square-eyed head, which screw is driven into the building at suitable places, and the bracket attached to the same by a wedge key bolt.

Claim.—The combination, with brackets A B C and the knee plate E E¹, of the screw G *a f* and key J, all arranged in the manner and for the purposes set forth.

No. 27,442.—RICHARD GILL and GEORGE W. GRIER, of Altoona, Pa.—*Improvement in Furnaces of Steam Boilers*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A deflector composed of two walls B² B³, which inclose an air passage C between them, and when the wall B² is furnished with openings, and the wall B³ is tight, and both

projecting forward over the fire, and when constructed, arranged and operating substantially as described and for the purpose set forth.

No. 27,443.—JACKSON GORHAM, of Bairdstown, Ga.—*Improvement in Organ Pipes*.—The object of this invention is to increase the quantity and quality of sound in organ pipes.

Claim.—Constructing organ pipes with two musical throats and mouths, both communicating with the foot *d*, for the purposes and substantially as set forth.

No. 27,444.—HENRY H. GRAHAM, of Patterson, N. J.—*Improvement in Connections for the Ends of Railroad Rails*.—Patent dated March 13, 1860.—This invention consists of a tapering bar combined with a clamp that is driven thereon at a joint between the bars, and acts to bind the rails, bar, and clamp together in such a firm manner, that the ends of the rail cannot separate.

Claim.—The tapering connecting bar provided with the lugs *l l* entering holes in the rails, in combination with the clamp *e*, driven on said wedge substantially as specified.

No. 27,445.—JOHN GUYER, of Westport, Conn.—*Improvement in Cultivators*.—Patent dated March 13, 1860.—The object of this cultivator is to weed between the growing crops. When the wheels are propelled by means of the handle *D*, the pressure exerted on the handle forces the wheels down on the ground at the same time the hoes are depressed, so that they work to the proper depth in the ground.

Claim.—The arrangement of the hoes *A*, springs *F*, guides *K*, handle *D*, axle *B*, and tubes *J*, as and for the purposes shown and described.

No. 27,446.—JASON W. HARDIE, of New York, N. Y.—*Improved Churn*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the hollow revolving cylinder containing hot water, or its equivalent, with a fixed surface fitting against its periphery, and adjustable to different degrees of closeness thereto, whereby not only are the cream globules effectually crushed, but the requisite degree of temperature is imparted to the cream only momentarily while passing beneath the cylinder, and is again dissipated mostly by the falling of the cream into the churn body below, substantially as specified.

No. 27,447.—LEVY HEYWOOD, of Gardner, Me.—*Improved Chain for Timber Bending Machines*.—Patent dated March 13, 1860.—This invention consists in so forming the links of the chain that they shall confine the stick upon two or even three sides.

Claim.—The chain herein described, operating as set forth.

No. 27,448.—W. W. HORTON, of Schuyler's Lake, N. Y., assignor to himself and LUCIUS O. VEBBER, of the same place.—*Improvement in Water Wheels*.—Patent dated March 13, 1860.—This invention consists in a novel formation or design of the bucket of a direct action centre-vent water wheel.

Claim.—The specific construction of the bucket hereinbefore described, embodying a straight line in combination with an involute of a circle, the straight line and involute being relatively arranged to each other and the face of the wheel, as set forth.

No. 27,449.—H. M. HUTCHINSON, of Baltimore, Md.—*Improved Furnace for Railroad Cars*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The hot-air chamber *A*, combustion chamber *C*, and feeder *F*, arranged as described, in relation to one another and to the car, and so that the cold air received by the combustion chamber may be drawn from the interior of the car.

No. 27,450.—EDWARD JULIER, of Beverly, Ohio.—*Improvement in Cultivators*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the slotted, adjustable, laterally connected compound beam and stock *g g 2 h* and *L L M*, Figs 1, 3, 4, when combined with the solid wrought metal compound mould and share *d e n o s*, Fig. 5, and when said combination is so arranged as that the heel or butt end of one cutting edge overcuts the point or toe of the advance share, admitting also of being adjustable more or less forward or backward relative to each other, substantially as set forth and described.

No. 27,451.—JOHN P. KENNEDY, of Trenton, N. J.—*Improvement in Clay Gas Retorts*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The securing of the mouth-piece to an earthen retort by means of an iron yoke or

band firmly clasping the neck of the earthen retort behind the collar, and having bolts on the outside of the retort passing to the flanch or mouth-piece—thus securing the earthen collar between the mouth-piece and the yoke or band; the whole being substantially as described.

No. 27,452.—LUCIUS J. KNOWLES, of Warren, Mass.—*Improved Safety Feed Apparatus for Steam Boilers*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the balls E and F, placed outside and communicating with the boiler at different levels beneath the water line, and so arranged as to operate successively, the one to regulate the pump, and the other to operate the whistle, as set forth.

No. 27,453.—DAVID KNOX and THOMAS DITCHBURN, of Lynn, Mass.—*Improvement in Sole Cutting Machines*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, giving a reciprocating or vibrating motion to the head D by means of the slot g and pin 9, substantially as set forth, and for the objects specified.

Second. The use of an eccentric bush in the eye of the connecting rods, substantially as described, for the purpose of raising or lowering the knives.

Third. Giving a lateral motion to the back gauge by the use of a swivel T, or in any equivalent manner, as described, so that both knives may be made to cut the same sized sole.

Fourth. The use of the double crank for actuating the connecting rods E F, in combination with the movable head D, substantially as and for the objects specified.

No. 27,454.—REINHOLD LANDSTROM, of Boston, Mass.—*Improvement in Coffee Roasters*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the lining of a coffee roaster of staves or pieces and heads of soapstone, and a metallic frame, applied together, substantially as described.

And I also claim the mode of making each bar or stave provided with steam escape holes, viz: with a channelled or grooved external surface, so as to form with the outer case of the roaster a steam passage open at the ends of the stave, and to be so covered at the outer case that the coffee may be protected from the smoke and gases of the furnace, as specified.

No. 27,455.—GEORGE W. LANE, of Boston, Mass.—*Improved Method of Testing Hollow Spheres for Water Gauges and other Purposes*.—Patent dated March 13, 1860.—The inventor says: In carrying out my invention I employ a strong cylindrical or other properly shaped air tight vessel A, made of a material capable of withstanding a very high degree of pressure, viz: several hundred pounds per square inch; the stronger the vessel the better. The upper end of the vessel should have an opening a and a closing cover b, or a man hole plate so applied as to enable the hollow floats to be tested to be introduced into the vessel A, or to be removed therefrom after having been tested.

Claim.—The described mode of testing hollow floats, to be used in steam boilers or other vessels in which great heat and pressure, or either, may be employed.

No. 27,456.—JOHN T. LOFT, of Brooklyn, N. Y.—*Improved Machine for Covering the Springs of Skeleton Skirts*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, covering wires or springs for hoop skirts by passing the same, in connection with strips or covers of suitable fabric having a suitable glue, cement, or adhesive substance applied to them through folders P, and between drawing and pressure rollers L M, arranged to operate substantially as and for the purpose set forth.

Second. The use of cutters a and disks or guides b f, placed respectively on the shafts F G K, in connection with the roller B, on which the fabric is wound, the glue or cement reservoir H, and the rollers I J, all being arranged substantially as and for the purpose specified.

Third. In connection with the glue or cement reservoir H and rollers I J, the reservoir C, and roller D, arranged relatively with each other, and the disks or guides f, on the shaft K, to operate as and for the purpose specified.

Fourth. The combination of the drawing and pressure rollers L M, folders P, roller N, glue or cement reservoir C H, with their rollers D I J, the roller B, cutters a, and guides b f, arranged for joint operation as and for the purpose specified.

No. 27,457.—FRANCIS C. LOWTHROP, of Trenton, N. J.—*Improvement in Plates for Securing Chords, Braces, &c., of Truss Bridges*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of plate A, with open slots adapted to receive, and arranged in respect to, the enlarged ends of the chord rods G and G¹, and also arranged to receive the verticals and diagonals of a truss, frame, or other bridge, substantially as and for the purpose set forth.

No. 27,458.—EDWARD MATTOCKS, of Lyndon, Vt.—*Improvement in Shutter Operators*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the devices set forth for controlling the movements of a window blind, whereby it may be unlatched, opened or closed and relatched, as circumstances may require, such devices being the rectangular tube C, the spring catch bar D, and the cord *f*, the same being arranged and made to operate together, substantially in manner as set forth.

No. 27,459.—THOMAS H. MCCRAY, of Moscow, Tenn.—*Improvement in Cotton Presses*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the toggle arms E E E E, so as to connect all the four bale boxes, as described, in combination therewith, whereby the same action of the power applied will both effect the pressing in one pair of bale boxes and bring back the other pair of bale boxes ready for pressing again, substantially as specified.

I also claim the employment of movable bale boxes, in combination of stationary bed blocks, substantially in the manner and for the purposes specified.

No. 27,460.—S. T. McDUGAL, of New York, N. Y.—*Improvement in the Manufacture of Gas*.—Patent dated March 13, 1860.—This invention consists in the combination, for the purpose of making gas for illuminating and other purposes, by converting the vapor of hydrocarbons into permanent gases, of an air blast and vaporizing chamber, a retort and furnace and a purifying vessel and gasometer constructed and operated together.

Claim.—The combination of an air blast, a vaporizing chamber, a retort and furnace, a purifying vessel, and a gasometer, arranged and constructed substantially as described.

No. 27,461.—THOMAS E. MCNEILL, of Philadelphia, Pa.—*Improved Hot Air Register*.—Patent dated March 13, 1860.—This invention consists in combining a net work, or its equivalent, of fibrous, or other material capable of absorbing moisture, and a reservoir for water with a hot air register, so that the hot air from the register may pass in contact with the fibrous material and take up the water which it has received from the reservoir; also in a device for obstructing the passage of the water from the reservoir to the net work when the veins of the register are closed.

The inventor says: I *claim*, first, combining a net work, or its equivalent, of fibrous or other material capable of absorbing moisture, and a water reservoir with a hot air register, substantially in the manner and for the purpose set forth.

Second. I claim the plate I, with its projection *i*, when connected with the bar D, and arranged in respect to the partition *e*, as and for the purpose set forth.

No. 27,462.—WILLIAM MITCHELL, of New York, N. Y.—*Improvement in Apparatus for Revivifying Bone Black*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, placing the cast metal plates I I on the fire arches J, arranged as shown, to wit: two being placed longitudinally in the chamber A, and the other transversely in a perforated partition, for the purpose of properly sustaining the plates I I, and at the same time permitting of a proper draught.

Second. The employment or use of two series or rows of chambers or tubes G H, placed at one or both sides of the fire chamber, when said chambers or tubes are placed in the position as shown, and the outermost rows made of smaller capacity than the innermost one, for the purpose specified.

Third. Having the chambers or tubes G H, made transversely, of egg form, (or of greater dimensions at one of their shorter curved sides than at the opposite ones,) and also made longitudinally and transversely of varying thickness, substantially as and for the purposes set forth.

Fourth. The arrangement of the flues J¹ K, in connection with the chambers or tubes G H, as and for the purpose described.

Fifth. The connecting of the coolers F, to the tube *d* of the chambers G H, by means of the ears or lugs *f* and hooks or pins *g*, as set forth.

Sixth. Forming the plates *k*, with fluted surfaces, so as to produce valleys or gutters *l*, and placing said plates in an inclined position on the top of the chamber L, for the purpose set forth.

Seventh. Connecting the chamber L, with the flues J¹ K, in the manner substantially as shown and described, so that the burning and drying processes may be performed simultaneously with one and the same source of heat.

No. 27,463.—GEORGE E. MILLS, of New York, N. Y.—*Improved Ore Washer*.—Patent dated March 13, 1860.—This invention consists in the construction and arrangements of the

channels in the bottom of which are countersunk slits or openings to discharge the water upon the revolving disk ; also the diverging rakes revolving in the opposite direction, and the flat or half round pipe to flow the ore from the disk and allow the hinged rakes to pass over freely, likewise the circular oblique riffles in the disk.

Claim.—The channels, the revolving rakes diverging from the centre, the oblique riffles in the disk, and the flattened or half round flow pipe, all in combination, as specified, and for the purposes set forth.

No. 27,464.—ANDREW J. MOSER, of New York, N. Y.—*Improved Book Ruler.*—Patent dated March 13, 1860.—This invention consists in curving the ends of a ruler in opposite directions and levelling the edges of the same in the usual manner, so that it may be used either side up as a book ruler.

Claim.—The book ruler, with curved ends, herein described and represented.

No. 27,465.—M. W. NALTON, of Utica, N. Y.—*Improved Measure Faucet.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says : I *claim*, first, the employment or use of a plurality of hollow cylinders or vessels A B connected by tubes C provided with cocks, arranged substantially as shown and described, to admit of the alternate filling and discharging of the vessels, for the purpose described.

Second. The dividing of one or more of the hollow cylinders or vessels into compartments by means of the partitions provided with the valves *g h* and rod H, arranged as shown, to admit of the drawing off of the contents of one or more of the compartments, as occasion may require, in connection with the index I and graduated arc, all for the purpose and in the manner set forth.

No. 27,466.—JOHN NORTH, of Middletown, Conn.—*Improvement in Drop Letter Boxes.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, applying to a drop letter box the inner lid, for the purpose of preventing the abstracting of letters from the aperture of the letter box, as described.

Second. I claim the inner lid, in combination with the outer lid, attached to a drop letter box, whereby the inside lid is closed on opening the outer lid, for the purpose as described.

No. 26,467.—GEORGE W. OSBORN, of Centreville, Mich.—*Improvement in Grain Cleaners.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the trough *d*, the elevators D, the fan E, and the shoe, as constructed, the trough being placed at the bottom of the shoes, with one end passing into the elevator case, and having an independent longitudinal vibration, substantially as and for the purpose set forth.

No. 27,468.—B. E. ORTON, of Lyndon, Ill.—*Improvement in the Mode of Applying Horse Power to Mills.*—Patent dated March 13, 1860.—The object of this invention is to combine a horse power and grinding mill in such a way that a very compact mechanism will be obtained, and one that will admit of the mill being detached and other machinery connected, when required, so as to be driven by it.

Claim.—The combination of the toothed rim G, stationary pinions *d d*, adjustable pinions *b b*, mill D, and the bevel gearing I J, with shaft K, arranged substantially as and for the purpose set forth.

No. 27,469.—F. J. PALMER, of Knoxville, Tenn.—*Improvement in Car Seats.*—Patent dated March 13, 1860.—This improvement consists in combining spring clasps *f* with the shoulder plates B of the seat arms A, in such a manner that when the hinge straps C are resting upon the shoulders *g* of the shoulder plates B, the spring clasps *f* can be closed and locked over the hinge straps, until such time as the conductor may see cause to reverse the positions of the backs of the car seats; when the spring clasps are unlocked they will fly back to the position shown by the dotted lines in the engravings.

Claim.—Combining a self-locking clasping apparatus with either or both of the shoulder plates B of a car seat, substantially in the manner and for the purpose represented and described.

No. 27,470.—F. S. PEASE, of Buffalo, N. Y.—*Improvement in Hydro-Carbon Vapor Apparatus.*—Patent dated March 13, 1860.—The object of this invention is to facilitate the operation of impregnating inferior gas with the vapor of hydro-carbon liquids, such as naphtha, benzoles, ether, &c. The gas passes over a series of shallow pans filled with the liquid, and,

in order to cause the gas to absorb the vapor more readily, is compelled to pass through a series of stops, of wire gauze or perforated sheet metal.

Claim.—The combination of the box A, when provided with a supply pipe C at the top, and with pans B and plates *b*, as shown, with the condenser E, constructed as set forth, the whole operating in the manner and for the purpose represented and described.

No. 27,471.—JAMES PEATFIELD and SANFORD PEATFIELD, of Ipswich, Mass.—*Improvement in Elastic Belting.*—Patent dated March 13, 1860.—The claim explains the nature of this invention.

Claim.—As a new article of manufacture, India rubber belting made upon a knitted foundation, and having a slight degree of elasticity, as set forth.

No. 27,472.—JOHN PROTZ, of Easton, Pa.—*Improved Knife and Fork Cleaner.*—Patent dated March 13, 1860.—This invention is designed for ordinary family use, and to be operated by hand.

Claim.—The box A provided at one end with the pressure block *k*, attached to springs *b b* in connection with the leather B secured to the inner side of the lid A of the box, and connected at one end to a slide *d*, all being arranged to form an improved article of manufacture, for the purposes specified.

No. 27,473.—LEWIS L. REYNOLDS, of Manchester, N. H.—*Improved Window Screen.*—Patent dated March 13, 1860.—This invention consists in combining and arranging, with a window, the rods *c c*, in such a manner that they serve the purpose of holding a mosquito window screen in the window by the pressure of their ends against the sides of the window frame, and also allow the screen to be rolled up, to suit the varying heights to which the window is desired to be raised.

Claim.—The combination and arrangement of the frame A with the rods C C, the pins D, and springs E, substantially as and for the purpose set forth.

No. 27,474.—WILLIAM RIKER, of Newark, N. J.—*Improved Process of Embossing Designs on Metal for Jewelry.*—Patent dated March 13, 1860.—In the engravings is seen the die roll A in its frame, and adjusted over and above a smooth or plain roll B, which is fitted also in the frame and so arranged that both rolls may be operated in opposite directions by means of the handles F, the rolls being set together as firmly as required by means of the screws *c c*.

The inventor says: I *claim*, first, the use of the softer metal, as at K, Fig. 1, substantially in the manner and for the purposes described.

Second. I claim the use of the die roll A, Figs. 1 and 2, substantially in the manner and for the purposes set forth.

No. 27,475.—E. D. ROSENCRANTZ, of New York, N. Y.—*Improved Telegraph Wires.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a compound wire for telegraphs, consisting of a silver centre and outside of copper, or other equivalent metals in which the centre is the best conductor, for the purposes set forth.

Second. I claim, in placing telegraph wires, the selection of the end leaving the draw plate, for the purposes substantially as set forth.

No. 27,476.—E. A. G. ROULSTONE, of Roxbury, Mass.—*Improvement in Trunks.*—Patent dated March 13, 1860.—This invention consists in making the body and ends of a trunk of corrugated metallic plates, so fastened together as to insure strong and water-tight joints.

Claim.—As a new article of manufacture, a trunk made of corrugated metallic plates, applied together substantially as set forth.

No. 27,477.—SILAS C. SCOFIELD, of Freeport, Ill.—*Improvement in Harrows.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination, with the teeth of a rotary harrow, of a strip of metal running spirally from end to end of the harrow, and fixed at an intermediate point between the ends of the teeth and the harrow shaft, as set forth.

Second. I claim, in combination with the harrow frame and rotary harrows of the wheel G, hung in arms H H, which are jointed to the main frame, standards J J, and driver's seat K, when this seat is connected to the frame by the jointed braces L L, and furnished with a set screw *b* for raising the frame A A, in the manner set forth, at the same time allowing the frame to swing freely on the joint *a*, and adapt itself to the unevenness of the ground.

No. 27,478.—WILLIAM SELLERS, of Philadelphia, Pa.—*Improvement in Turning Lathes*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing lathe heads in the form of a hollow box, and revolving the spindles in journals which are connected together and surround the spindle throughout its length, substantially as described, and for the purposes specified, whether said journals are so arranged as to form a continuous bearing throughout the entire length of the spindle or not.

Second. I claim attaching the heads of a lathe to the bed in such a manner that a line drawn from the axis of a spindle perpendicular to the upper surface of said bed shall fall on or about the back edge of the bed, substantially as described and for the purpose specified.

Third. Constructing lathe beds with their upper surfaces horizontal, or substantially so, when this is combined with one other surface on the bed and corresponding surfaces on the heads, which surfaces being brought in contact shall insure the parallelism of the axis of the spindle, substantially as described.

Fourth. I claim the use of a plate bed having its upper surface divided longitudinally into two similar parts, each part having its edges bevelled so that the slide rest may be attached to either side, substantially as described and for the purpose specified.

Fifth. I claim the combination of the internal and external gearing on the same face plate, for the purpose of obtaining the required variation of speed and of stiffening the plate, substantially as described.

No. 27,479.—WILLIAM SHERBURNE, of Charlestown, Mass.—*Improvement in Scarf Pins*.—Patent dated March 13, 1860.—The object of this invention is to furnish a more secure fastening for the point of the pin after it has been passed through the shirt or other garment, and consists in moving up by means of a screw, a cap or cup over the point of the pin to hold it so that the pin cannot escape or be withdrawn until the cap is withdrawn by turning back the screw.

Claim.—Locking the pin *b* by turning the screw *d*, substantially in the manner set forth.

No. 27,480.—WILLIAM H. SHERWOOD, of Greenwich, Conn.—*Improved Composition for Artificial Stone*.—Patent dated March 13, 1860.—The ingredients composing this article are mixed in the following proportions: Alum, 2 ounces; soluble glass, 1 pint; solution of rosin, 4 ounces; water, 4 gallons. When these articles have been mixed, 3 gills of the mixture is added to one pound of Keen's cement.

Claim.—The within described composition of Keen's cement, alum, soluble glass, rosin, and water, mixed together in about the proportion stated, and for the purposes specified.

No. 27,481.—ROBERT A. SMITH, of New York, N. Y.—*Street Sweeping Machine*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arm or lever *B*, hung on and concentric with the main broom shaft *a*, moving as a radius therefrom; the lower part of said arm runs on the street by means of slides or rollers; the upper end *Y* is adjusted and secured as described.

I also claim the cup or concavity *J*, and inclined plane *I*, immediately under and adjusted to the circle described by broom *G*.

I also claim the inclined plane or spout *K* for conveying the dirt delivered by broom *G* into rows outside the cart wheel; this inclined plane can be supported at the highest end by hinges or springs, or by their equivalents, the lower end, by chains.

No. 27,482.—T. J. SOUTHARD, of Richmond, Me.—*Improved Hawse Pipe*.—Patent dated March 13, 1860.—This invention is an improvement in hawse pipes through which the cables pass when the ship is at anchor; these pipes are made of metal, and situated under the ship's head, and are employed to prevent the chains from rubbing or chafing the hull of the vessel. The claim and engravings will give an idea of the nature of the improvement.

Claim.—A hawse pipe extending into or through the side of the vessel, and provided on the outside end with a flanged head and cheeks containing a roller, substantially as described, for the purposes set forth.

No. 27,483.—MARCUS STEVENS, of Detroit, Mich.—*Improved Self-Adjusting Reclining Chair*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the apron or front piece *C* hinged to the seat, in combination with the braces *b*, secured to the sides of the apron and hinged to the arms *D*, and pivoted to the stationary frame or body of the chair between the arms and the seat, substantially as shown and described.

Second. The detachable foot board, in combination with the hooks in the backs of the

front legs, and made reversible relatively to the front or apron piece of the chair for attachment thereto at pleasure in either of the two directions specified.

No. 27,484.—THOMAS THORP, of New York, N. Y.—*Cigar Heading Socket*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the cigar heading socket made in one, two, or more parts, so constructed and arranged as to be attached to any cigar making machine, or in such a manner that the socket can operate to give a proper finish to various sizes of cigar heads, substantially as set forth.

I also claim, in connection therewith, the hinging of the parts A and E, at the point *a*, for the purpose set forth.

I also claim the said cigar heading socket with the opening *m*, made in the form and so as to operate as described, whether with or without the hinge *a*.

No. 27,485.—AUGUSTUS TUFTS, of Malden, Mass.—*Improvement in Lanterns*.—Patent dated March 13, 1860.—This improvement consists in constructing a lantern not only with a series of horizontal belts on the exterior of the glass cylinder, but also with a series of vertical refracting ribs on the interior of the lantern, whereby the lights are elongated and multiplied.

Claim.—In a lantern the combination of a series of horizontal refracting zones or belts formed on the exterior of the lantern, with a series of vertical ribs formed on the interior thereof, substantially as described, whereby the lights are both multiplied and elongated, as set forth.

No. 27,486.—ENOCH B. TURNER, of Providence, R. I.—*Improvement in Brakes for Railroad Cars*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the simultaneous operation, by the momentum of the train, of the brakes upon the shoes on the wheels, in two or more railroad cars, through the action of the bar A connected with the shoes, in the manner substantially as described.

I also claim the stirrup D, and its combination with the cord described; one extending through the train, and the other connecting that cord with the stirrup, substantially as described for the purposes set forth.

No. 27,487.—DAVID UTLEY, 2d, and PELL TEEB, of Leicester, N. Y.—*Improvement in Straw Cutters*.—Patent dated March 13, 1860.—F is the frame of the machine, K the large knife working in guides *g* in front of the mouth of the machine attached at one end of the lever L, which is connected by a bolt with the lower part of the frame, this lever giving it a drawing stroke, and also assisting to raise it above the mouth for the fodder to be fed forward, the power being applied to the knife K by the pitman P from the crank shaft S.

Claim.—The arrangement of the knives K *K*¹, levers L *l*, pitmans P *p*, slotted guide G, crank shaft S, hopper H, concave bed *c*, and toothed roller R, as and for the purposes set forth.

No. 27,488.—JOHN WALCH, of New York, N. Y.—*Improvement in Stoves*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application and combination with a stove of an air chamber, constructed and arranged as described, said chamber rising directly from the lower part of the stove base until within a short distance of the top of the stove, and forming first the back part of the fire place or fire pot, and then a distinct division in the stove from one side to the other side of the stove, whereby the flame and gases are made to pass upon the front over the top and down in the rear of said chamber to the smoke pipe, in the manner and for the purpose substantially as specified.

No. 27,489.—A. F. WALDO, of Dryden, N. Y.—*Improvement in Grain Cleaners*.—Patent dated March 13, 1860.—The grain leaves the shoe G G of the hopper, and falls into the cup R, on the projection P. It passes along the bottom of the cup R and enters the spout S, when by the action of the blast and its gravity it is carried across the spout and strikes the opposite side, when being reflected it falls into the middle of the spout, and thence through the perpendicular portion of the spout into the grinding portion of the stone.

Claim.—The combination of the fan B, spouts O and S, valve V, and spring F, the cup R, slide K, and projection P, when constructed and arranged as specified, for the purpose of cleaning grain as the same is fed into the eye of the millstone.

No. 27,490.—WILLIAM WATSON, of Bishopville, S. C.—*Improvement in Ploughs*.—Patent dated March 13, 1860.—The plate E has an eye *e* on its upper end, into which a wedge *f*, pivotted on the standard B above the plate, is forced and serves to elevate the upper end of

the hook plate, and depress the lower end of the same, and thus cause the hook to take a firm hold upon the mould board D, and retain it in its place.

Claim.—The combination of the pivotted clamping hook plate E, fastening wedge *f*, standard B, and mould board D, substantially as and for the purposes set forth.

No. 27,491.—FRANCIS F. WELLS, of Texana, Texas.—*Improvement in Pessaries.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, in the construction of pessaries, the particular manner of hinging the ring D to the tube A, and to the lever *c*, passing through said tube, so that the said ring may be readily turned on the tube and firmly held thereto when in its proper position for supporting the uterus, as substantially set forth and explained.

I also claim the particular manner of uniting the ring to the frame, viz: by means of the recesses in the ring and the swinging button S on the lever *b*, the whole being arranged and combined for the purpose of ready removal and replacement of the ring, for cleansing the instrument or changing the ring, substantially as represented.

No. 27,492.—WILLIAM ORTON WILLIAMS, of Washington, D. C.—*Improvement in Bridle Reins.*—Patent dated March 13, 1860.—This invention consists in crossing the bridle reins in such a manner that when the reins are held in one hand and moved to the right or left they may exert no counteracting influence on that side of the horse's mouth opposite to the direction in which you wish him to move.

Claim.—The combination of a ring, or its equivalent, with the crossed reins of a bridle, and this I claim whether combined with the martingale or not.

No. 27,493.—R. A. WILDER, of Cressona, Pa.—*Improvement in Railroad Switch Stands.*—Patent dated March 13, 1860.—The lock *i* is arranged in the body of the lever C; a shield F is then placed around it, so as not only entirely to secrete it but to form also a protected space for the bolt *e* to work in. The bolt *e* has a notch or recess 7 in it, into which the bolt 8 of the lock *i* shoots.

The inventor says: I *claim* the so arranging the lever *b*, that connects the bolt *e* with the main lever C, as that the operator, by one hand, may seize and operate both levers, substantially in the manner and for the purpose described.

I also claim, in combination with the lever C and the bolt *e* a locking mechanism and the shield F, for protecting the lock and bolt, substantially as described.

No. 27,494.—REUBEN WOOD, of Grand Ledge, Mich.—*Improvement in Jacks.*—Patent dated March 13, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The combination of the pawls and ratchet bar with the disks D¹ D² D³, having annular inclined tracks E F, on their faces, between which rollers or balls may travel continuously in one direction, or alternately back and forth, in such a manner as to change the progressive speed at which the ratchet bar is worked by a different manipulation of the hand lever, substantially as and for the purposes specified.

No. 27,495.—HORACE WOODMAN, of Biddeford, Me.—*Improvement in Machines for Cleansing Machine Cards.*—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says, I *claim*, first, raising, suspending, cleansing, and replacing the top flat cards by incline planes J, moved within the carding machine and between the arches and the end of the main cylinder, and the brush bar L, placed, secured to, and operated by and between these incline planes and over the card cylinder, essentially in the manner and for the purposes fully set forth.

Second. I claim the secondary incline planes M, so constructed and connected to the main incline planes J, as to elevate themselves by contact with top flat cards, and they in turn elevate the top flat cards when these incline planes M, pass from the feed roll towards the doffer, and they being depressed by contact with and also the top flat cards with them, in the return movement, and bring the card teeth of the cards and brush bar effectually together for cleansing the cards, essentially in the manner and for the purpose fully set forth.

Third. I claim imparting an intermittent motion to the brush bar L, by the combination and arrangement of the notched wheel D², pawl E, and cam G², in the manner set forth.

Fourth. I claim imparting to the incline planes J and M, a complete and then a partial movement to first cleanse all the top flat cards once, and then one or more the second time, and then back again to give an increased or double cleansing to the top flat cards most needing it, essentially in the manner and for the purposes fully set forth.

Fifth. I claim imparting first a complete and then a partial movement to the brush bar L, by means of the stud H², and arm I², combined with pawl E², cam or guide G², and wheel D², or any equivalent combination, essentially in the manner set forth.

Sixth. I claim so arranging and operating the brush bar L, in combination with comb T,

that the latter will cleanse the former at each cleansing it gives the top flat cards, essentially in the manner and for the purposes set forth.

No. 27,496.—A. J. WOODWORTH, of Henrico County, Va.—*Improvement in Soap*.—Patent dated March 13, 1860.—The inventor says: In making my washing soap I mix fifteen pounds of common washing soap, one gallon and a half of soft water and one half ounce of spirits of hartshorn, one half pound of sal-soda, one teaspoonful of spirits of wine, and two pounds of bleaching soap.

Claim.—As an article of manufacture, a compound soap, which has for one of its ingredients bleaching soap, and which is made substantially of the ingredients set forth in the proportions specified.

No. 27,497.—ABRAM GAAR, of Richmond, Ind., assignor to himself, JOHN M. GAAR, and WILLIAM G. SCOTT, of said Richmond.—*Improvement in Grain Cleaners*.—Patent dated March 13, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim* separating the grain, chaff, and straw by providing the grain carrier as well as the straw carrier with separate boards E K, on which the grain is collected, and from which it is discharged separately to the fanning mill, substantially in the manner and for the purpose described.

I also claim arranging the upper line of the open straw carrier below and under the lower line of the cell carrier, when combined with a shaker F, and with the separating boards E g K, so as to produce a fall between the two carriers for the purpose of facilitating the separating of the grain from the straw, as described.

No. 27,498.—FRANCIS A. HOYT, of Boston, assignor to himself, GEORGE W. LANE, WILLIAM G. HOWE, and ALFRED W. ADAMS, of said Boston.—*Improved Magnetic Gauge for Steam Boilers*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the lever arm box D, the indicator, steam column and case, and the float lever E, and float F, together and relatively to the boiler head, substantially as described.

I also claim the application of the fulcrum bearings to the lever arm box, and so as to be movable therewith and separate from the boiler head.

I also claim my improved arrangement of the magnet and its armature H, with reference to the interior or steam space of the boiler, the said arrangement consisting not only in placing the magnet in an indicating or other proper chamber, entirely insulated from or having no connection with the said steam space or the armature chamber, so that steam can pass therefrom into the magnet chamber, but in arranging the armature with respect to the magnet and applying the float to the armature, so as to operate it substantially in the manner as described.

I also claim combining a separate index pointer with the magnet so as to extend therefrom, as specified.

No. 27,499.—WILLIAM L. R. MATTASON, of Rochester, N. Y., assignor to himself and J. M. FRENCH & Co., of said Rochester.—*Improved Feathering Paddle Wheel*.—Patent dated March 13, 1860.—The wheel B turns freely on its axle, and is connected to the paddle wheel by cranks c c, which being of corresponding length with the distance between the centres of the two wheels, allow them to revolve together, the effect being to keep the cranks in the same direction constantly, viz: on a line with the two centres.

Claim.—The bearing resting arm or shoulder, substantially as and for the purpose of adjusting the centre of the eccentric wheel, as described.

No. 27,500.—ZURIEL SWOPE, of Lancaster, Pa., assignor to himself, H. D. MUSSLEMAN, and WILLIAM D. SPRECHER, of said Lancaster.—*Improvement in Lamps*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the funnel E, and pipes F G and H, with such relation to the wick tube I, that heat may be taken from the flame and passed down into the lamp under the wick tube, so that the heated oil will rise towards the flame and around the wick, substantially as and for the purpose specified.

No. 27,501.—HALSEY D. WALCOTT, of Boston, Mass., assignor to MARTIN L. BRADFORD & Co., of said Boston.—*Improved Scissors and Nippers*.—Patent dated March 13, 1860.—The object of these is to supply the want of a convenient instrument for grasping the end of the thread to draw it through the eye of the needle, when in sewing machines it is in an inconvenient position to be taken hold of by the hand.

Claim.—As a new article of manufacture, a pair of scissors with the points of the blades formed into nippers, substantially as described.

No. 27,502.—Cancelled.

No. 27,503.—FRANKLIN W. WILLARD, of New York, N. Y., assignor to himself and E. G. ALLEN, of Boston, Mass.—*Improvement in Apparatus for Distilling*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method described of distilling and evaporating liquids, the same consisting in the employment of a revolving still, provided within its interior with a series of buckets, whereby while the still is maintained at a uniform temperature, the liquid which is to be acted upon is kept in motion, and portions of the same successively separated, taken up, and returned to the mass in thin films, substantially as specified and for the purposes set forth.

No. 27,504.—DANIEL H. WISWELL, of Buffalo, N. Y., assignor to CHARLES W. ADAMS, of Evans, N. Y., and DEBBY PINNER, of said Buffalo.—*Improved Churn*.—Patent dated March 13, 1860.—This invention consists in the application of the scoops or arms B, inserted in a shaft marked S, one at the base, the upper edge of which scoop leans backward ten degrees; the second, one third distant to the left, the upper edge of which leans backward five degrees; the third, one third distant from the second, and above the other at right angles. The placing of the scoops inclining at such different degrees is for the purpose of throwing the milk, or cream, against the ribs marked C, and upwards against the inner cover A.

Claim.—The inner cover marked A of the form described, the scoops or arms marked B, the sharp edge and slant of the upper part of ribs marked C, combined and arranged as specified, for the purposes set forth.

No. 27,505.—ALBERT H. WRIGHT, of Philadelphia, Pa., assignor to I. C. FULLER and B. I. WOODWARD, of said Philadelphia.—*Improved Elastic Chain or Surge Spring for Ships' Cables*.—Patent dated March 13, 1860.—This invention consists in the arrangement and combination of blocks or layers of elastic gum or India rubber with the links of a chain adapted for the purpose.

Claim.—The combined arrangement of the links A, elastic blocks B, and swivel bolts *e*, the same operating together in the manner and for the purpose specified.

No. 27,506.—S. F. VAN CHOATE, of Yreka, Cal.—*Improvement in Electric Telegraphing*.—Patent dated March 13, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of a system of connections, substantially as described, connecting the main circuit of one line of electric telegraph and the local circuit of another line in such manner that, by opening the main circuit of one line, the current of its local circuit shall produce an interruption to the current of the main circuit of the other line by repulsive action, as specified.

I also claim the employment of a substantially similar system of connections, operating in a substantially similar manner, to render any electric circuit continuous or interrupted at pleasure by the closing and opening of another and entirely separate circuit.

No. 27,507.—STEPHEN M. ALLEN, of Niagara Falls, N. Y.—*Improvement in the Treatment of Fibrous Plants*.—Patent dated March 20, 1860.—This invention consists in subjecting the material acted upon to heated air, charged with water up to its point of saturation. The action of this saturated air softens and separates the elements that hold the fibres together, without destroying or injuring its natural structure, and opens the capillary tubes so that the albumen, resinous, and coloring matters can be readily reached and removed by water.

Claim.—The new mode of treating fibrous materials, such as flax, hemp, jute, manilla, grass, sugar cane, &c., the same consisting in subjecting them to the action of air charged or saturated with moisture or vapor, substantially as set forth.

No. 27,508.—JOHN ASHCROFT, of Lynn, Mass.—*Improvement in Low Water Safety Apparatus for Steam Boilers*.—Patent dated March 20, 1860.—This invention consists in the employment of a tube or pipe of fusible alloy, which is introduced into the length of and forms part of the pipe which is connected with the boiler, so that the water from the boiler may circulate over its interior surface and prevent the incrustation of the metal.

Claim.—A fusible tube D, or its equivalent, arranged in a pipe communicating with the boiler, as set forth, for the purpose described.

No. 27,509.—N. L. BABCOCK, of New Haven, Conn.—*Improvement in Breech Loading Fire Arms*.—Patent dated March 20, 1860.—This invention consists in the construction of the cock and its application with the pawl or dog for holding the barrel in close connection with the stock and breech, and in the ready manner of disengaging the same for loading.

Claim.—The combination and arrangement of the spring catch and hammer, whereby the detent E is securely held in place and forced home by the hammer C, when constructed substantially in the manner and for the purposes specified.

No. 27,510.—GEORGE BAILEY, of Buffalo, N. Y.—*Improved Machine for Printing Railroad Tickets*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the printing of coupon tickets for railroads and other lines of travel, and numbering said tickets with their coupons in successive order or series, by one operation of the press, by means of an arrangement of a chase *e f* to hold the types for the ticket and its coupons and sets of numbering wheels corresponding to the ticket and coupons upon one press, operating so as to imprint the ticket upon a fillet of paper, properly fed along to receive said printing, as set forth.

I also claim the mechanism for feeding the paper under the types, in such manner as to perform likewise the operation of perforating or partially separating the coupons from each other and from the ticket, so as to be readily torn apart at the place of such perforations—consisting of two rollers or cylinders *W W*¹, one of which is plain, and the other armed with a series of rings *z*, having teeth upon them, which press upon or pass into the other or plain roller, so that the points of the rings will cut through or perforate the paper, and thus, by the act of perforation, secure the necessary grip to feed the paper, as described.

No. 27,511.—E. BALL and M. L. BALLARD, of Canton, Ohio, assignors to E. BALL, of said Canton.—*Improvement in Harvesters*.—Patent dated March 20, 1860.—The heel of the finger bar *C* is fastened in a recess in the shoe *B*. The heel of the cutter bar *f*, to which are fastened the cutters *F*, works in front of the projection or piece *j* of the shoe *B*, while the front of the cutter, which is fastened to the heel of the cutter bar, works under the lip *B*¹ of the shoe and the rear edge under the steel cap *A*.

Claim.—The combination and arrangement of an adjustable steel spring cap plate with the heel of the cutter bar and the shoe which supports the heel of the finger bar, substantially as described and shown in Figs. 1 and 2 of the drawings.

No. 27,512.—JAMES H. BANTA, of Piermont, N. Y.—*Improvement in Joint Chairs for Railroads*.—Patent dated March 20, 1860.—This invention consists of a moving block applied within the chair, combined with a longitudinal key passing through the chair and acting to press the block both against the side of the rail and down on the flange, whereby the ends are firmly and durably connected to each other.

Claim.—The block *c*, formed with the projection 4, taking beneath the key *d* and the flange 3, setting over the part 6 of the chain *b*, the whole constructed and acting substantially as set forth.

No. 27,513.—A. C. BARSTOW, of Providence, R. I.—*Improvement in Cooking Stoves*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The double plate *d d e e* extending from the bottom to the top plate and throughout the width of the stove, forming a partition chamber *f f* so arranged as to separate the fire chamber from the flues, when said plate or chamber is provided at the top, or thereabouts, with apertures or openings *g* respectively, for the admission to and evacuation from said chamber of external air, whereby a continuous and rapid circulation of fresh air is necessarily created and maintained through and by the heat of the chamber, for the purposes herein specified, in combination with the flue passages near the top and at either end of said partition chamber, by which three or more boiler apertures can be used on the front of a stove and over a comparatively small fire, and the heat be applied equally to each, and by which also, when the heat has passed from the fire chamber, it is first applied to the ends of the oven where it is most needed.

No. 27,514.—E. BATES, JACOB WEIST, and MICHAEL WEIST, of York, Penn.—*Improvement in Shoemakers' Floats*.—Patent dated March 20, 1860.—This invention consists in a peculiar means employed for admitting of the self-adjustment of the float *E* and handle *B*, and, at the same time, holding the float sufficiently firm in any position relatively with the handle that may be required in using the tool.

Claim.—The combination of the curved dog *D* with the float or rasp *E*, springs *C C*, and rod *A*, when arranged and constructed as and for the purposes shown and described.

No. 27,515.—ROBERT BEANS, of Johnsville, Penn.—*Improvement in Guard Fingers for Harvesters*.—Patent dated March 20, 1860.—The wings *D* are so formed that when the fingers are arranged on the beam their ends shall come in contact, and thus serve as braces to cause all the fingers to render mutual support to each other.

Claim.—Forming the guard with curved wings *D*, extending on each side to serve as braces, and forming a crotch in their rear above the body or depressed portion of the finger, leaving a space between the rear of the wings and the front of the cutter bar and the open

spaces d^1 , on each side of the finger; the whole arranged to operate as described for the purpose set forth.

No. 27,516.—JOHN BOSTWICK, JR., and ABNER ALDEN, of Dedham, Mass.—*Improvement in Car Couplings*.—Patent dated March 20, 1860.—The India rubber cylinders or cushions C C^1 are received into corresponding recesses in the shell, and are sustained in their place by means of axis pins, and act as guides for directing the link D to its place in the operation of coupling the cars together. These cylinders rotate freely on their axes in the operation of pushing the link D between them.

Claim.—The combination of the rotating rubber cylinder C and C^1 , for directing and controlling link D , substantially as described.

No. 27,517.—A. J. BELL, of Greenupsburg, Ky.—*Improvement in the Arms of Carriage Axles*.—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—In the construction of an ordinary compound truss axle A B C , making each of the arms thereof in two parts, a b , and with an oil space i , one of said parts being placed edgewise, vertically, and the other flatwise, horizontally, and both united together by a collar h and screw nut j , substantially as and for the purposes set forth.

No. 27,518.—WILLIAM H. BELL, of Washington, D. C.—*Improvement in Revolving Fire Arms*.—Patent dated March 20, 1860.—The main feature developed in this invention is adapting the stem on which the cylinder revolves to containing or supplying the wafer or other primer continuously to the cap nipples of revolving fire arms.

The inventor says: I *claim*, first, the use of a hollow axial stem D , furnished with a discharging device E , in combination with a revolving fire-arm, substantially as and for the purposes set forth.

Second. The employment of a spring device J^1 , in combination with a guide box K , for holding the primer securely in line with the nipples after it is elevated by the slide, and guarding it until the hammer explodes it, substantially as and for the purposes set forth.

Third. The combination of the barrel stop or dog h with the cock I , by means of a spring hook-shaped extension G of the primer lifting slide G , substantially as and for the purposes set forth.

Fourth. The combination of the sliding pin L with the series of primers and with the cock I , substantially as and for the purposes set forth.

Fifth. The combination of cam N with the sliding pin L , substantially as and for the purposes set forth.

No. 27,519.—DIXON BROWN, of Norfolk, Va.—*Improved Pin Fastening*.—Patent dated March 20, 1860.—This invention consists in attaching the pin directly to the plate, and having the pin coiled at its junction with the plate to form a spring, which will have a tendency to keep the point of the pin towards the plate, and using in connection with the pin thus coiled a claw or pointed prongs, which are attached to the plate.

Claim.—The pin B attached directly to the plate A , and coiled at its junction therewith, to form a spring a , in connection with the claw C , substantially as and for the purpose set forth.

No. 27,520.—J. D. BURDICK, of Newburn, N. C.—*Improvement in Operating the Slats of Window Blinds*.—Patent dated March 20, 1860.—This invention consists of a lever or pivotted handle, provided with a pressure spring, acting against a square or polygonal surface on the end of the lever, so that when the two parts are connected with the slat bar, the slats will be locked in their two extreme positions, and at any intermediate point at which they may be set they will remain in a fixed state.

Claim.—The lever D , constructed as described and represented, spring G and vibrating connecting rod F ; all arranged and combined, forming a new article of manufacture.

No. 27,521.—SARAH D. CARMAN, of Middletown, N. Y.—*Improved Reclining Chair*.—Patent dated March 20, 1860.—This invention consists in the manner of attaching the back to the seat, whereby the back is rendered susceptible of two different adjustments relatively to the seat, and the back rendered capable of being secured in a more or less inclined position, and also further forward or backward on the seat so as to increase or diminish the depth of the same.

Claim.—Attaching the back of a chair, sofa, or other seat, to its seat by means of a hinge or joint C , one or more, formed of two curved concentric bars a b , attached respectively to the seat and back, and with each other, substantially as and for the purpose set forth.

No. 27,522.—WILLIAM S. CARR, of New York, N. Y.—*Improvement in Valves for Water Closets*.—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the independent cup leather valve i , controlled in its

motion by a cylinder having a water leakage, and closing against the end of a cylindrical passage between the supply and discharge pipe, substantially as set forth.

Second. I claim a slot x , in a cylinder containing a cup leather or plunger, for the purpose of allowing water to pass gradually from one side of said cup leather or plunger to the other to regulate the gradual closing of a valve in water closets as specified.

Third. I claim closing the water passage in the valve before opening the induction valve, so that there is no leakage or waste of water consequent upon the use of two valves acting successively in opposite directions, and neither of which may be upon their respective seats as set forth.

Fourth. I claim a cylindrical passage or waterway f , between the supply and discharge pipes combined with an elastic washer or plunger q that is forced into said waterway, and acts on the valve i substantially as specified.

No. 27,523.—VOSCO M. CHAFEE, of Xenia, Ohio.—*Improvement in Mowing and Reaping Machines*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the platform on the frame in the manner I have described, and hanging it upon the centre or axle of the driving wheel J , and a corresponding centre m in the frame, by means of the arms T and m , and in making the arm T a part of the centre piece F , wherein one end of the shaft h has its journal, so that the arm T , the shaft h , and the platform H , shall all vibrate together about the same centre, and these I claim only when the whole is arranged substantially as described.

No. 27,524.—JAMES CLARK, of Baltimore, Md.—*Improvement in Sealing Lock for Railway Cars*.—Patent dated March 20, 1860.—This invention consists in providing the lock with a projecting stud c , perforated with a hole and a latch B , having an opening a that allows the stud to project through it, so that a sealing wire b may be passed through the perforation of the stud after the latch is in its place on the lock.

Claim.—As a new article of manufacture, the perforated stud c rising from the lock plate, as described, when employed with a swing latch and wire, for sealing the lock, the whole constructed as specified.

No. 27,525.—LUCIUS H. COLBY, of Groton, N. Y.—*Improvement in Wagon Jacks*.—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I claim, first, the described hook H and slide G , for the purpose of holding the lever D in its place at any desirable position or altitude, when raising the wagon wheel off the ground.

Second. I claim so making the hook-shaped prawl that it shall clamp the rod by its leverage on the rod or slide and further its turning on the said rod, for the purpose of suiting the lever when in either series of holes in the plate, as described.

Third. I claim the combination as a whole, when composed of the standard, the plate C , with double series of holes, the lever, the slide or rod, the hooked prawl, clamping by its leverage at any point on the rod or slide by the action of the said lever, when the said combination is made and operated as described.

No. 27,526.—J. MASLIN COOPER, of Pittsburgh, Pa.—*Improvement in Revolving Fire Arms*.—Patent dated March 20, 1860.—This improvement is in the constructing and arranging of the parts of revolving fire arms so as to be adapted to fire either kind of ammunition (fixed or loose) by simply changing the revolving breech.

The inventor says: I claim, first, so constructing and arranging the lock and revolving cylinders c c^1 of revolving breech fire arms, substantially in the manner hereinbefore set forth, as that the same fire arm may be equally well used either with a cylinder open at both ends and carrying fixed ammunition charged at the rear, or with a cylinder constructed so as to load from the front and carry loose ammunition, or ordinary powder and ball.

Second. The mode hereinbefore described of rendering revolving breech fire arms susceptible of firing either fixed ammunition loaded from the rear or powder and ball charged into the front end of the breech, by the use with a single fire arm of two or more cylinders of different constructions to suit the different kinds of charge, so arranged in combination with the lock barrel of the fire arm as that either may be used at pleasure.

No. 27,527.—JOHN B. CORNELL, of New York, N. Y.—*Improvement in Safes*.—Patent dated March 20, 1860.—This invention consists in interposing between the inner and outer metallic walls of the safe a sheet or sheets of metallic plaster holding plates, which are swayed into alternating dove tail elevations and depressions, so that when the filling of any suitable anti-plogistic compound is put in, on both sides of this central wall, and allowed to set or dry, it will be attached firmly to the wall, and will not detach itself from it by shrinking or settling.

Claim.—Forming the interior fire proof wall of safes by interposing between the two layers of plaster the continuous metallic plate A, or any other suitable plate possessing the retaining shape, for the purposes and essentially as described.

No. 27,528.—JOHN B. CORNELL, of New York, N. Y.—*Improvement in Double Cylinder Fire Proof Columns.*—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—Constructing an architectural column of two concentrically arranged cast iron tubes *a b* and an intermediate solid mass of fire proof composition, when the said parts are combined with each other in such a manner as to form but a single article of manufacture, which shall possess the characteristics set forth.

No. 27,529.—JOHN Q. COWELL, of Vernon, Ind.—*Improvement in Apparatus for Tanning.* Patent dated March 20, 1860.—This invention consists in such an arrangement of the several vats A B C as that the fluids contained in any vat may be transferred to any other vat in the tannery, by means of a system of troughs D, pipes A¹ B¹ F, and syphons.

Claim.—The arrangement of the vats and troughs to each other, as set forth, when said vats are provided with an angular space, separated from the basin of said vats by partitions, as set forth.

No. 27,530.—RICHARD T. CRANE, of Chicago, Ill.—*Improvement in Air Heating Furnaces.* Patent dated March 20, 1860.—The operation is as follows: the boiler C is supplied with a requisite quantity of water, and a fire is kindled in the fire chamber B. Steam will soon be generated in the boiler C, in consequence of a great heating surface being presented to the fire chamber. The steam fills the tubes F and chamber G, and a large radiating surface is thereby obtained in the chamber A, the air in passing up through said chamber A being quickly heated to the temperature of the tubes and chamber G.

The inventor says: I *claim*, first, the combination with an air chamber A and fire chamber B of the boiler C, tubes F, and steam chamber G, substantially in the manner and for the purposes described.

Second. The combination, with the fire chamber B, steam boiler C, tubes F, and steam chamber G, of the draught regulating and fire extinguishing devices described, substantially as and for the purposes set forth.

No. 27,531.—S. DAGGETT, JR., of Charleston, S. C.—*Improvement in Car Couplings.*—Patent dated March 20, 1860.—This coupling is self-locking, as the action of the shackle causes the rolling weight to change its position from the rear to the front end of the chamber in which it is inclosed, and by the motion of the chamber the working pin is pushed up and made to pass through the shackle.

Claim.—The arrangement of the hinged hollow chamber D with the rolling weight F and buffer arm E, in combination with the pin B and shell A, constructed and operating substantially as and for the purpose specified.

No. 27,532.—FLORIMOND DATICHY, of Paris, France.—*Improved Apparatus for Reworking the Waste Steam of Steam Engines.*—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the method herein described of utilizing or reworking the exhaust steam or other escaping gas or vapor of an engine, by subjecting it, first, to a partial condensation and afterwards applying heat to evaporate its liquified products, and then injecting it, after its temperature and elasticity have been increased, in the form of steam or vapor, into the boiler for use over again, as specified.

Second. The employment of separate reservoirs, maintained at different temperatures, to receive successively the exhaust steam, gas, or vapor of the engine, and operating, first, to partially condense the steam, and afterwards to evaporate its liquified products and to increase its temperature and elasticity prior to its return to the boiler, there to be reworked, essentially as set forth.

Third. The employment, in combination with the exhaust steam receiving reservoir or reservoirs above named, of a worm or coil of pipes or other suitable heater, arranged in close proximity to the boiler furnace, for increasing the tension of the exhaust steam prior to its return in a vaporous form to the boiler, substantially as specified.

Fourth. Passing the exhaust steam in a vaporous form from its receiving chamber or reservoir to the worm or heater, by means of pumps or their equivalents, essentially as described.

Fifth. Causing a jet of steam from the boiler, or of working pressure, to be injected into the worm or heater, to raise the tension of the exhaust steam and to drive it into the boiler and control the suction of the pumps employed in supplying the heater and with exhaust steam, as set forth.

No. 27,533.—ALEXANDER DEAN, of Richmond, Ind.—*Improved Washing Machine*.—Patent dated March 20, 1860.—This invention consists in the use of two circular brushes C D, in combination with a tub B, the brush D being secured to the bottom of the tub, and the brush C forming the rubbing disk or follower; also, in the arrangement of levers E H and links F G with the tub and follower, for the purpose of vibrating the tub and follower in opposite directions simultaneously.

The inventor says: I *claim*, first, the combination of the vibrating disk or brush C with the vibrating tub B and brush D, or the equivalents to D, herein described, the whole being arranged in a manner substantially as described.

Second. The combination of the lever E and links F G with the brush C, tub B, and disk D, substantially as shown.

No. 27,534.—CALEB W. DYER and D. M. CUMMINGS, of Enfield, N. H.—*Improved Shingle Machine*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, bringing one corner of a block of wood in contact with the teeth of a circular saw, and then imparting such a character of feeding movement to the said block as will enable the saw to cut its way through to the diagonal corner of the same, and in such a manner that the kerf lines on the main portion of one side of each shingle thus formed will be nearly parallel with the grain of the wood, all substantially as set forth.

Second. We also claim the combination of the carriage F¹ and the block holder F with each other and with the laterally movable plate G, the longitudinally movable plate O, the bearers N N¹, and the stop plates a a¹, substantially in the manner and for the purpose set forth.

Third. We also claim the undogging of the shingle block at the proper moment of time, and then dogging it again in a different position within the block holder, in the manner set forth.

Fourth. We also claim our improved method of imparting the forward and rearward movements to the carriage F, viz: by means of the cams j k on the face of the cam wheel U, which operate through the medium of the reciprocating sliding plate W¹, the vibrating lever W, and the auxiliary devices which are combined with the said parts, substantially in the manner set forth.

Fifth. We also claim the peculiar arrangement of the parts for transmitting different degrees of motion from the saw shaft I to the horizontal shaft S, viz: the broad bevel faced friction wheel I¹ on the saw shaft being secured thereto in such a manner that it is compelled to rotate therewith at the same time that it can be moved up and down the same, whilst the narrower bevel faced friction wheel S¹ is rigidly secured to the inner end of the shaft S, and the journals of said shaft are of such a length that it can be moved lengthwise to any desired extent by means of the hand lever K, or the equivalent thereof, substantially in the manner set forth.

No. 27,535.—JOHN EBNER, of Lancaster, Pa.—*Improvement in Shutter Operators*.—Patent dated March 20, 1860.—When the shutters are closed the headed bolt K drops into its catch L, and a touch on the tilter H inside will also bolt the shutter beneath the catch Q. They are opened by touching the other side of the tilter H; the beak G is withdrawn from its catch Q; and the other end comes in contact with the hook M on the rod I, and unlocks K.

Claim.—The push and pull bolt, with its joints A B C, and sliding box D, pivot Y on the plate Z, attached to the shutter; the weighted bolt K, operated on a pivot by a rod, with its hook M, and the double beaked tilter G and H, on the rod P, the stay plates F, when combined substantially as set forth for the purpose specified.

No. 27,536.—PEARSON EMBREE, of West Chester, Pa.—*Improved Churn*.—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The employment in a churn of a series of slats A A¹ A² A³, or projections B B, attached to the inner surface, and so arranged that each row shall point obliquely in the line of motion of the churn, and the slats in each successive row point in opposite directions, substantially as described.

No. 27,537.—JAMES E. EMERSON, of San Francisco, Cal.—*Improvement in Saws*.—Patent dated March 20, 1860.—This invention consists in having the saw provided with adjustable teeth, and portions of the under sides of the same and edge of the saw provided with a flanch of a width nearly equal to the cutting edges of the teeth, whereby the sawdust is discharged from the kerf, and the choking of the saw is avoided.

Claim.—The adjustable teeth B, in combination with the flanches C, formed on the inner sides of the teeth, and on the edge of the saw plate, substantially as and for the purpose set forth.

No. 27,538.—WILLIAM EMMETT, of Galveston, Texas.—*Improvement in Machines for Polishing Marble*.—Patent dated March 20, 1860.—A perforated or slatted rubbing or polishing surface to correspond to the surface to be polished is connected with a shifting box, and with a water reservoir in such a manner that a continuous supply of sand and water, in the required quantities, to the surface to be rubbed or polished is effected.

The inventor says: I *claim*, first, the arrangement of the rubbing surface F K or L, in combination with the sand box E, water box C, and shifting box A, or their equivalents, substantially as and for the purpose described.

Second. The employment of the rollers F F¹, or their equivalents, arranged for operation substantially as described, for the purpose of rubbing fluted columns.

No. 27,539.—JAMES HENRY BURTON, of Jefferson County, Va.—*Improvement in the Manufacture of Gun Barrels*.—Patent dated March 20, 1860; patented in England September 29, 1859.—This invention consists in the process of constructing a barrel of steel or iron of a uniform bore and exterior taper without welding.

Claim.—The making of gun barrels by drawing them down from a cylinder between grooved rolls C C, and over graduated mandres 1 2 3, so that they shall not only be reduced in diameter and in the size of the bore at each successive pass, but also tapered externally, substantially as set forth.

No. 27,540.—GEORGE A. ENGELHARD, of New York, N. Y.—*Improvement in Varnishes*.—Patent dated March 20, 1860.—The inventor says: I dissolve caoutchouc, gutta percha, and kindred vegetable substances, in one of their well known solvents, such as chloroform, benzole, chloride of carbon, &c. This solution is brought in contact with chlorine by passing a stream of gaseous chlorine into the same, in order to bring said chlorine in immediate contact with the gum contained in the solution. The solution, which is of dark color when first made, turns brighter as the chlorine begins to take effect, and after a certain time it becomes yellow, when the combination of the caoutchouc, gutta percha, and kindred vegetable substances, with the chlorine is perfected. The solvent is now removed by treating the solution with alcohol, which combines with the solvent and causes the new product to precipitate. After removing the solvent the new product is well washed with alcohol, and then dried. This new product when perfectly dry is dissolved in chloroform, bisulphuret of carbon, chloride of carbon, benzole, the quantity of which solvent is to be taken proportionate to the desired thinness or thickness of the solution.

Claim.—The use and application of the solution in question as a varnish suitable for wood, plaster of Paris, paper, photographs, ambrotypes, and as a varnish upon new metallic substances.

No. 27,541.—BENJAMIN D. EVANS, of Mount Vernon, Ohio.—*Improvement in Furnaces*.—Patent dated March 20, 1860.—The object of this invention is to obtain a furnace that will be capable of being used as a boiler and evaporator in the manufacture of sugar and for other purposes.

The inventor says: I *claim*, first, the combination of the furnace A and its attachment D, provided with the cold air chambers *b g*, and arranged to operate as and for the purpose set forth.

Second. The combination of the register B, furnace A, attachment D, cold air chambers *b g*, flue E, dampers *j F*, and boiler B¹, when arranged as shown, so that the above-named parts may be used jointly, and also admit of the furnace A being readily detached and used separately.

No. 27,542.—H. P. GENGEMBRE, of Allegheny, Pa.—*Improvement in Apparatus for Distillation of Coal*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a cylindrical or polygonal retort F, having at the centre of both ends a hollow journal or tube *f*, and being susceptible of receiving a continual or occasional movement of rotation or oscillation around its own axis, for the purpose specified.

Second. The construction and arrangement of the pillow blocks or of the friction wheels, as described, when used for the purpose of causing the motion of the retort itself to make the substance under treatment travel from one end to the other of the retort, and said retort to charge and discharge itself automatically.

Third. The charging box, constructed and operated as described, in combination with the retort, and for the purpose specified.

Fourth. The discharging tube, when used in combination with the hollow journal of a movable retort, as described, for the purpose specified.

Fifth. The gas pump fan T, or exhauster, the pipe V, the tube H, and the pipe *f*, as described, when forming part of a close circuitous conduct for returning over and over the permanent gases in the retort, substantially as specified.

No. 27,543.—RICHARD C. HARRINGTON, of Newark, N. J.—*Improvement in Gas Retorts*.—Patent dated March 20, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—The employment of a screw R, fitted to the cylindrical retort, substantially as described, in combination with openings C D, provided at the top and bottom of the retort, near the same end thereof, as described, for the purpose of arranging or distributing the charge and withdrawing the residuum.

No. 27,544.—MARK HOWLAND, of Waterbury, Conn.—*Improvement in Adjustable Stops for Window Frames*.—Patent dated March 20, 1860.—In order to remove the stops from the casing the screws F are unscrewed from the nuts *d d*, and, in order to adjust the stops nearer to or further from the sash C, the screws F are loosened or slightly unscrewed and the stops shoved towards the lower sash, the oblong slots *b* of the plates *a* permitting such adjustment; the screws F are then screwed into their nuts, and the washers E made to bind firmly against the plates *a*.

Claim.—The nuts *d* fitted in the stiles *c* of the window casing, the screws F, the slotted plates *a* in the stops D, and the washers E, to form fastenings for securing stops to window casings, substantially as described.

No. 27,545.—JAMES INGRAM, of New York, N. Y.—*Improvement in Fitting Sinks*.—Patent dated March 20, 1860.—This invention consists in a wall plate *a* attached directly to the brick work or plastering by wall hooks, and to this plate the sink is attached. In this plate the pipes *b b* are cast for conveying the water to the faucets and air chambers *c c* to relieve the concussion, the water pipes themselves being connected to the thimbles 1 1, cast so as to project from the end of the wall plate.

The inventor says: I claim a plate *a* attached directly to the wall or other support, when the pipe or pipes, air vessel or air vessels, are cast in such plate, and the water pipes connected to the thimbles 1 1, or their equivalents, as specified, and for the purposes set forth.

I also claim the arrangement of the flanges 4 and 5, for sustaining the sink and shedding off any water that may splash upon the plate *a*, when such flanges are formed on the said plate, as specified.

No. 27,546.—ABRAM H. JONES, of Fallsington, Pa.—*Improvement in Sewing Machines*.—Patent dated March 20, 1860.—This invention consists in the arrangement of the shuttle driver K, whereby the shuttle may be released from, and replaced in, a position to be acted upon by the said driver.

Claim.—The reciprocating slide L, its permanent projection *n* and the movable bent arm *p*, in combination with, and arranged in respect to, the double-pointed shuttle, as and for the purpose set forth.

No. 27,547.—JOHN H. KAUFMAN, of Lisburn, Pa.—*Improvement in Railroad Cars*.—Patent dated March 20, 1860.—This invention consists in having the bodies of the cars fitted between ways or guides on the platforms of the trucks and having racks on the under surfaces of the bottom of the cars, the racks gearing into pinion attached to shafts on the platform of the trucks, rim shafts being connected to springs, or their equivalents.

Claim.—The combination, with the car body D and platforms A, of the racks F, pinions and shafts G H, and springs I, substantially as and for the purpose shown and described.

No. 27,548.—LEVI S. LAPHAM, of Providence, R. I.—*Improvement in Lubricators*.—Patent dated March 20, 1860.—The object of this invention is to combine an oil chamber and pump in such a manner that the same may be applied to a steam cylinder and oil injected into the cylinder, or into parts connected therewith, by the simple action of the plunger only.

Claim.—The combination, with the cylinder A, pump cylinder D, and piston F, of the annular oil passage *k* and annular valve *j*, perforated in the centre, as shown, so that when the piston is withdrawn, the valve *j* will rise and the oil will enter the cylinder D, and when the piston is pushed down the valve *j* will close the passage K, and the oil will pass through the centre of the valve *j* to the machine to be lubricated, all as set forth.

No. 27,549.—PHINEAS LEACH, of Lewiston, Me.—*Improvement in Weather Strips for Doors, &c.*—Patent dated March 20, 1860.—The flanges *b* serve to attach the strip to the edge and sides of the door, so that the semi-circular part *a* of the strip C projects beyond the edge of the door, and when the same is closed this part of the strip adapts itself to the frame and closes the crevices existing between the door and the frame.

Claim.—A door strip, made of rubber or other elastic material, having a semi-circular part *a* with a flange *b* upon either side, as shown and described.

No. 27,550.—WILLIAM T. LEACH, of East Wareham, Mass.—*Improved Forging Machine*.—Patent dated March 20, 1860.—This invention consists in the manner of applying the hammers, in combination with their rock shafts, for the purpose of preventing the breakage of the hammer arms or other connection of the rock shafts.

Claim.—The combination of the arm *d* of the hammer hub, the mortised stud *G*, and the mortised arm *I* of the hammer rock shaft, the whole applied and operating together substantially as set forth.

No. 27,551.—C. V. LITTLEPAGE, of Austin, Texas.—*Improvement in Millstone Dress*.—Patent dated March 20, 1860.—This invention consists in the employment or use of curved furrows laid out or draughted on the face of the stone in a peculiar way, whereby the grain will be cut or reduced to a pulverulent state by a cutting action.

Claim.—The millstone dress shown and described, when made and laid out in the manner set forth, for the purpose specified.

No. 27,552.—JOHN B. MARVIN, of New York, N. Y.—*Improved Portable Furnace*.—Patent dated March 20, 1860.—The opening *a* serves to attach the blaze pipe *D*, and the opening *b* admits the blast from the wind pipe *E*, the mouth of which is kept at a greater or smaller distance from the opening *b*, according to the lower or higher temperature required, and according to the force of the blast.

Claim.—The combination, with a furnace *A*, of a blaze pipe *D*, and a wind pipe *E*, constructed and operating substantially in the manner and for the purpose specified.

No. 27,553.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Hose Tubing*.—Patent dated March 20, 1860.—This invention consists in first covering a thin woven tube *a a* with a sheet or coating of India rubber *b b*, and then turning the hose inside out; another woven tube *c d e*, a little larger than the first, is then slipped or drawn over this woven tube, so as to fit tightly.

Claim.—A hose or tubing formed of two or more concentric, woven, seamless tubes, composed of flax, cotton, or other fibrous materials, one over the other, the innermost one having a lining formed, either wholly or in part, of India rubber or gutta percha, as set forth.

No. 27,554.—EDWARD MAYNARD, of Brooklyn, N. Y.—*Improved Tassels for Window Curtains, &c.*—Patent dated March 20, 1860.—This invention consists in covering the mould with glue or cement, and then applying "flock" thereto.

Claim.—As a new article of manufacture, the tassel mould, covered in the manner specified.

No. 27,555.—GEORGE MCKOWN, of Altona, Ill.—*Improvement in Upsetting Tire*.—Patent dated March 20, 1860.—The object of this invention is to obtain a device for upsetting, contracting, and punching tires for wheels, so that the former may be readily made to fit and be secured to the latter without being cut and rewelded.

The inventor says: I claim the stationary plate *H*, provided with an eccentric toothed jaw *h* and a lip *f*, in connection with a movable or sliding plate *D*, provided with a cap plate *a* having an eccentric jaw *e* and lip *f*, and operated by the toggles *E E* and screw rod *F*, substantially as and for the purpose set forth.

I further claim, in connection with the stationary and the sliding plate, and operating mechanism above named, the punch *J* and bolster *K* applied to the plates, as and for the purpose set forth.

No. 27,556.—DAVID L. MILLER, of Madison, N. J.—*Improvement in Hay and Cotton Presses*.—Patent dated March 20, 1860.—This invention consists in combining, with an open head press, of a suitable size and strength to resist lateral pressure, two movable followers having a simultaneous movement to or from each other, which is to be imparted to them by an arrangement of ropes or chains which are wound up, in opposite directions on a shaft, operated by a worm screw and wheel and suitable cranks or levers connected therewith.

Claim.—The combination, with the press box *A*, of the two followers *E E*¹, with their stripping bars *G G*², rollers *b b*, and hooks *c c*, pulleys *d d* working loose on their shafts *L*, shaft *K*, and worm wheel and worm shaft *N P*, the latter being hung in a pivotted bracket and operated as set forth, when these several parts are all arranged as and for the purposes described and represented.

No. 27,557.—JOHN MILLER, of Saltpeter, Ohio.—*Improvement in Water Wheels*.—Patent dated March 20, 1860.—This invention consists in making the facing to water wheels, known as the overshot, pitch back breast or wheel, of one fourth the width of the diameter of the wheel, to prevent the water from entering the wheel, and providing it with valves at the place where each arm is connected with the facing.

Claim.—The pivotted valves B, in connection with the conductors E E, in the manner and for the purpose described.

No. 27,558.—GEORGE W. MORGAN, of Prattsburgh, N. Y.—*Improvement in Self-Acting Wagon Brakes.*—Patent dated March 20, 1860.—C is the clasp that holds the ends of the bent levers B, and is secured to the hind bolster. D is a triangular shaped block fitted to the inner angle of the hind braces; it is the same thickness as the braces G, so as to allow the bar A to rest upon the braces when secured to the coupling bar; and when thus made, the bar A and block D will keep the hind traces in position without a bolt in the upward end of the braces as in other wagons.

Claim.—The arrangement of the clasp C and brake bar A, substantially as described, for the purpose of operating the brake levers, as set forth.

No. 27,559.—WILLIAM MORGAN, of Middlebrook, Va.—*Improved Churn.*—Patent dated March 20, 1860.—The churn being filled the operator seizes the handles of the sliding frame D, and by alternately pulling and pushing, imparts a horizontal reciprocating motion to the frame which gives a rapid motion to the dasher shaft, causing it to revolve first in one direction and then in another. The combined action of the inclined perforated beaters and breakers is such as to cause a violent agitation and thorough division of the particles of milk.

Claim.—The combination of the inclined perforated dashers or beaters *b*, the removable perforated breakers *a*¹, with the sliding frame D, when arranged for joint operation as described, for the purpose set forth.

No. 27,560.—SOLOMON MOYER, of Shimersville, Pa.—*Improved Machine for Bending Felloes.* Patent dated March 20, 1860.—The stick of wood to be bent for a felloe is laid into the spring clamp 6, and the wedges 5 5 are driven up tight; whereon it is placed on the slide rest D, between the mould H and clamp O, which is drawn up tight by the thumb screw 2, the nuts 7 7 are clamped on to the revolving screw E by means of the lever V and cranks 1 1, when the rest D is drawn forward by the revolving screw to the desired distance; whereon the belt is shifted on the loose pulley, and the slide rest brought to a stand, and by turning the crank P the rollers J J press the spring clamp 6 and felloe *m* tight up to the mould H.

Claim.—The sliding mould rest D, when operated as described, in combination with the tightening clamp O, thumbscrew 2, and lever V, in connection with the cranks 1 1 for operating the half nuts 7 7, when constructed as and used for the purpose set forth.

No. 27,561.—JOHN S. NOLEN and CHARLES C. HINCHMAN, of Paulsboro', N. J.—*Improvement in Boot Crimping Machines.*—Patent dated March 20, 1860.—This invention consists in giving elasticity to the follower, which is interposed between two jaws for the purpose of facilitating the removal of the finished boot front, and so that it will adapt itself to the convex surface of the former, when said former is forcibly brought down upon it with the leather attached thereto.

Claim.—The follower G, springs J J, with adjustable jaws B D, and former H, when the same are arranged and combined essentially as and for the purpose set forth.

No. 27,562.—FRANCIS ODELL, of New York, N. Y.—*Improvement in Attaching Thills to Vehicles.*—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The key D, or equivalent, in combination with the head C on the end of the thill iron, and jack F, having a socket formation on its outer end, as described, for the purpose of forming a coupling for attaching thills to axles, substantially as set forth.

No. 27,563.—CLARK D. PAGE, of Rochester, N. Y.—*Composition for Artificial Stone.*—Patent dated March 20, 1860.—The claim explains the nature of this invention.

Claim.—The manufacture of an artificial glauconitic building stone, in the above-stated manner, of glauconitic earth or loam, such as is found in the cretaceous and some other geological formations, with the admixture of either cement, or sulphate, or hydrate of lime, substantially as described.

No. 27,564.—J. B. PALSER and G. HOWLAND, of Fort Edward, N. Y.—*Improvement in the Preparation of Straw for Paper Pulp.*—Patent dated March 20, 1860.—Our "Staple Fibre" is made from common rye or wheat straw, or other stalks. In preparing it the straw, or other fibrous substance from which it is made, is first cut into short lengths through the agency of any suitable cutting mechanism, then winnowed to remove impurities, then crushed and abraded by being passed between iron rollers; after which it goes through a process of steaming, boiling, &c.

Claim.—As an improved article of manufacture, the staple fibre, substantially as set forth.

No. 27,565.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Machine for Filling Sausages*.—Patent dated March 20, 1860.—In operating this machine, motion being given to the wheels, by means of the crank with one hand, the meat is fed into the hopper B with the other, and is gathered towards the middle of the hopper by the action of the wheels and carried in between them, being pressed by the wheel C into the vacancies between the teeth D, and as the teeth D enter those vacancies the meat is forced through the spaces at the bottom of the vacancies into the pipe G, one end of which being closed it is obliged to come out at the other through the tube O into the cases.

Claim.—The combination of the gear wheel or roller C, and the wheel D, with the pipe G, substantially as and for the purposes described.

No. 27,566.—REUBEN ROLPH, of Coventry, N. Y.—*Improvement in Trace Safety Bars for Vehicles*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the construction and arrangement of the metallic plate and longitudinal rod across the thills, the upright posts and rollers, between which continuous or connected traces are hitched, so as to render, laterally, the arrangement of the lever and sliding bolt to hold the traces in position for draft, and admit of them being detached instantly, all in combination as specified, for the purposes set forth.

Second. I claim, as a modification of the above, the double connected vibrators for hitching traces to vehicles, as described, for the purposes set forth and specified.

No. 27,567.—WILLIAM RICHARDS, of Barcelona, Spain.—*Improvement in Wet Gas Meters*.—Patent dated March 20, 1860.—This improvement relates to the construction of the revolving cylinder, or series of measuring chambers of water gas meters, in order to reduce as much as possible the amount of variation in the quantity of gas measured by any variations between the maximum and minimum height of water, or other such fluid, in the meters.

Claim.—The adaptation and combination of means in water gas meters, whereby the more accurate admeasurement of gas may be obtained, substantially as explained.

No. 27,568.—ARTEMAS ROGERS, of Painesville, Ohio.—*Improved Machine for Bending Wood*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a pair of vibrating segments to produce a single bend in a piece of timber, when so arranged and controlled as to commence simultaneously at both ends of the stick to bend it, and by the completion of the process, constitute the mould, having a continuous curvature.

No. 27,569.—FREDERICK M. RUSCHHAUPT, of New York, N. Y.—*Improvement in the Adaptation of Substances as Motive Powers*.—Patent dated March 20, 1860.—The object of this invention is to produce a liquid which forms a gas of great elastic force and is easily condensed, and does not act injuriously upon the vessel containing the same, or upon the engine in which it operates, but really becomes a lubricator to all the working parts with which it comes in contact.

Claim.—The application of vapor from the liquid set forth, as a motor or propelling agent in engines, as specified.

No. 27,570.—JAMES SANGSTER, of Buffalo, N. Y.—*Improved Churn*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the paddles Z and C and G, with the partition E, when said partition is provided with openings H J I K, near its centre, and with openings L M N O, near its periphery, which are partially covered by caps, as seen, for the purpose of passing the cream around and around through the openings, from circumference to center, and *vice versa*, substantially as specified.

No. 27,571.—THOMAS SCHOFIELD, of Grass Valley, Cal.—*Improvement in Floating Bridges*.—Patent dated March 20, 1860.—The object of this invention is to support bridges, light houses, or other structures above water in places where the depth of the water does not allow of the application of pillars commonly used for supporting such structures, and consists in arranging a series of hollow globes or cylinders made of iron, or other suitable material several fathoms below the surface of the water, where they are retained by chains secured to anchors to hold the globes or cylinders steady.

Claim.—The arrangement of the cylinders A, or their equivalents, with arms C, steadying rods B, standards D, and valves e, substantially as and for the purpose specified.

No. 27,572.—G. H. SEALEY and JAMES LEE, of New York, N. Y.—*Improved Case for Exhibiting Stereoscopic Pictures*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the shaft D, roller F, and bands E, or their equivalents, substantially in the manner and for the purpose specified.

Second. Having the ends of the aprons, or of the bands which carry the picture holders, firmly secured to the rotary shaft D, or its equivalents, substantially as specified, so that the whole chain of pictures is subjected to a uniform and positive strain, in whatever direction the shaft is turned.

Third. The arrangement of the spring clasps *d*, in combination with the cross bars *c*, substantially as and for the purpose set forth.

Fourth. Arranging the picture holders G, with wooden cross bars *c*, substantially as described, so that the same allow of being attached to the bands or apron in a ready and cheap manner.

No. 27,573.—WILLIAM SEWELL, of New York, N. Y.—*Improvement in Surface Condensers for Steam Engines*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and use, in the manner shown and described, with the tubes and tube sheets, and follower or plate D, of a series of independent elastic rings, for the purpose set forth.

Second. The simultaneous compression of the whole or a portion of said series of elastic rings by means of a plate D, either whole or divided, substantially in the manner and for the purpose shown and described.

Third. The employment of the flanged tubes in combination with the plate D, and said rings, as and for the purpose shown and described.

No. 27,574.—A. SHERMAN, of Poughkeepsie, N. Y.—*Improvement in Attaching Thills to Vehicles*.—Patent dated March 20, 1860.—The object of this invention is to form a simple and efficient arrangement for coupling shafts or thills to the clips to make the attachment secure and to prevent a rapid wear of the parts, and to prevent noise occasioned by the wear and rattling of the thill irons in the clip.

Claim.—The slotted semi-cylindrical enlargement B, on the end of the thill irons, rubber packing E, pin J, jaws G, the clips with their slots and the pins *a*, projecting from the sides of the enlarged portions B, when the same are all combined and arranged in the manner and for the purposes set forth.

No. 27,575.—O. SHERWOOD, JR., of Independence, Iowa.—*Improvement in Railroad Gates*.—Patent dated March 20, 1860.—This invention relates to that class of gates which are made to open and close by the action of the approaching and departing train, so that the track is thrown open only to let the train pass. The action of the wheels of the train on two hinged additional rails cause the gate to rise, keeping the same up until the last pair of wheels of the last car in the train have passed off from said hinged rails, when the gate descends by its own gravity.

Claim.—The arrangement of the pulley D, pinion *d*, toothed sector *e*, and lever E, in combination with the hinged rails G, bar F, and gate A, constructed and operating as and for the purpose substantially as described.

No. 27,576.—WILLIAM N. SLAYSON, of South Reading, Mass.—*Improvement in Pumps*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Connecting the rocker piston to the curved rim of its case, and so applying such rim to the remainder of the case as to enable both piston and rim to be moved together, or simultaneously, relatively to the said remainder of the case, as specified.

No. 27,577.—JOHN SMALLEY, of Bound Brook, N. J.—*Improvement in Sewing Machines*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a hollow stationary "spool case" capable of containing different sized spools of cotton, with a rotating hook or looper, substantially as described, for the purpose set forth.

Second. I claim so arranging the spool case as that the needle shall always descend into the centre of the spool placed in it, as described.

Third. I claim the formation of the spool case S, in the manner specified, with a centralizing and steadying shaft S¹, substantially as set forth.

Fourth. Disclaiming the passing of the needle thread around an ordinary spool carrying the lower thread, when the said spool changes its position relatively to the other parts of the

machine, I claim passing the needle thread around an ordinary spool containing the lower thread, remains always in a fixed position, substantially in the manner described.

Fifth. I claim the rotary hook and vertically fixed spool in combination with a needle carrying its thread into the centre of the spool, substantially in the manner and for the purposes described.

No. 27,578.—WILLIAM E. STEIN, of New York, N. Y.—*Improved Dress Lifter*.—Patent dated March 20, 1860.—A is a waist band intended to fasten at the back by means of a hook and eye, or other fastening; *a a*, *b b*, are four flexible tubes attached to the front of said band and so held in place by means of a piece of cloth, or other fabric B, connecting them with each other and with the band so that when the band is on the waist and fastened behind, the two tubes *a a* will hang in front of the hips and the two longer ones *b b* will pass over and behind the hips.

Claim.—A dress lifter composed of a waist band A, fabric B, guide tubes *a b*, cord *c d*, tapes *g*, and weights *i*, arranged and constructed as set forth and described.

No. 27,579.—WILLIAM STEWART, of Philadelphia, Pa.—*Improvement in Grinding Mills*.—Patent dated March 20, 1860.—This invention consists in attaching the running grinder to its shaft in such a manner that it will have a certain degree of play and be self-adjusting, so as to conform to the position of the stationary grinder and at the same time be rendered capable of being adjusted to grind fine or coarse.

Claim.—The arrangement of the runner C, tubular shaft F, conical hub I, key J, slot *h*, spring K, absorbent *j*, and screw M, as and for the purpose shown and described.

No. 27,580.—D. B. TIFFANY, of Xenia, Ohio, and S. W. SOULE, of Milwaukee, Wis.—*Improved Machine for Printing Addresses on Newspapers, &c.*—Patent dated March 20, 1860.—This invention consists in the use of a pressure lever, travelling form, and peculiar means employed for operating the same.

The inventors say: We claim the combination of the pressure lever F and the chase B, containing the form; the chase being operated from the lever, as shown, or in any other equivalent way, and the pinion D¹ made to perform the double function specified, substantially as and for the purpose set forth.

Second. We claim raising or separating the particular line of type forming the address to be used from the remainder of the type in the chase, in the manner set forth, or an equivalent manner, for the purpose specified.

Third. We claim the sheet metal plate J, or its equivalent, for returning the type to their proper positions, substantially as specified.

Fourth. We also claim a traversing partitioned galley or chase, for holding and dividing the addresses, substantially as and for the purpose specified.

No. 27,581.—PHILIP UMHOLTZ, of Fremont, Pa.—*Improved Coal Breaker*.—Patent dated March 20, 1860.—This invention consists in constructing the teeth of coal breakers of two different sizes, and in arranging them in alternate rows parallel to the driving shafts and upon rollers of equal size, so that the large teeth of each roller shall be opposite to the small teeth of each other one; also in the arrangement for allowing the driving shaft to turn in the driving wheels so as to prevent breakage of machinery, when stone, &c. get in with the coal.

Claim.—The combination of the clutch I, as constructed, with the rollers B and B¹, constructed as set forth, operating as described and for the purposes set forth.

No. 27,582.—T. R. VAN GELDER, of Damascus, Pa.—*Improvement in Collecting Toll from Grist Mills*.—Patent dated March 20, 1860.—B is an inclined spout which is placed at one side of the wheel A, and has an open space in its side adjoining the wheel A. The shaft C of the wheel has its bearing *c*¹ in a frame D, the spout B being secured in said frame, and also a vertical spout E, which communicates with a garner containing the grists.

Claim.—The arrangement and combination of the toll spout B, vertical wheel A, open bucket *b*¹, and the spout E, as and for the purpose shown and described.

No. 27,583.—DAVID VAN KLEECK, of Cohocton, N. Y.—*Improvement in Harvesters*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the arrangement of the reversible draft bar L, connecting the tongue G, with the frame A, between the frames A D, in such a manner that it may be reversed without turning the machine, substantially as set forth.

I also claim the adjustable reel K, made to change from side to side by the cutter bar, without unbanding, by means of the shifting links O, and pulleys *g h*, substantially as described.

I also claim the reverse cutting or two edged sickle *f*, in combination with the centre guard plate *b*, and shifting apron *n*, substantially in the manner and for the purposes set forth.

No. 27,584.—GEORGE WALKER, of Springville, N. Y.—*Improved Washing Machine*.—Patent dated March 20, 1860.—The object of this invention is to subject the clothes to be washed to a squeezing as well as to a rubbing process. The rubber in this machine is arranged on an arm, or arms, connecting with a radius bar in such a manner that by imparting to the rubber a rolling motion, it assumes at the same time a longitudinal sliding motion over the clothes, subjecting them to the rubbing process, while the weight of the rubber with its attachments, regulated, if necessary, by a downward or upward pressure of the hand, is sufficient to exert the necessary pressure on the clothes.

Claim.—The combination of the radius bar *F*, with the tub *A*, rod *D*, lever *E*, and convex rubber *C*, as shown, so that said rubber will have a combined rotary and longitudinal motion, as and for the purpose shown and described.

No. 27,585.—SYLVENUS WALKER, of Boston, Mass.—*Improved Bedstead*.—Patent dated March 20, 1860.—This invention relates to an improvement in the manner of constructing, arranging, and connecting together the parts of a bedstead frame of light and cheap construction, which may be readily connected and disconnected.

Claim.—The end fastening *D*, as constructed and arranged, for the purposes set forth.

No. 27,586.—REUBEN WARREN, of Jefferson, Ohio.—*Improvement in Boot Crimping Machines*.—Patent dated March 20, 1860.—The inventor says: To use my machine I pass the leather under the "broke," draw up the corners, and take hold of them with the pincers *L*; the jaws being properly adjusted I gradually work the lever up and down, carrying the leather gradually into the jaws in the way of the wrinkles, at the same time I turn the crank *M*, thus raising the leather up against the "broke," this gradually brings the leather into form.

Claim.—The flexible jaw bolt and thumb screw, in combination with the "broke" pincers, and tongues, as stated, for the purpose of crimping leather only.

No. 27,587.—ALEXANDER T. WATSON, of Castleton, N. Y.—*Improvement in Railroad Car Springs*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, the manner of arranging and combining the two springs *B B*¹ in pairs of different lengths and curves, so that when pressure is applied, the one spring gives out its elastic force from compression, and the other, as soon as acted on by the first spring, yields an elastic force from tension; the two together affording an increasing strength and elastic power as the pressure increases.

Second. I claim the form of the frame or setting *A A*, by which the springs are held in position and made to act in the manner described.

No. 27,588.—GEORGE WESTINGHOUSE, of Schenectady, N. Y.—*Improvement in Crank Boxes*.—Patent dated March 20, 1860.—This invention consists in a novel way of securing the slide in the box, whereby the slide may be readily adjusted, and the box properly fitted to the crank wrist, and the crank at the same time firmly secured in position without the liability of being thrown out from the wrist during the rotation of the same.

Claim.—The slide *D*, fitted within the dovetail slot *C* of the body *A* of the box, in connection with the screw bolt *E* passing through the body *A*, and an oblong slot in the slide, substantially as and for the purpose set forth.

No. 27,589.—JOHN M. WHITNEY, of Bolton, Mass.—*Improved Odometer*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim so constructing an odometer that the revolutions of the wheel of the vehicle are registered equally reliable, in whichever direction the said wheel may be rotated.

I also claim the combination of a series of ratchet wheels on one centre, with a series of operating slide bars driven by cams on the ratchet wheels, substantially as described, for the purpose set forth.

I also claim the employment of a rubber, or other equivalent cushion, in combination with the yielding castor holder *K*, as specified, for the purpose set forth.

No. 27,590.—BARNABAS WOOD, of Nashville, Tenn.—*Metallic Composition for Fusible Alloy, and other purposes*.—Patent dated March 20, 1860.—The claim explains the nature of this invention.

The inventor says: I claim the composition of matter or alloy, consisting of the following proportions of cadmium, lead, and tin, or any modification thereof, substantially as indicated, so as to produce a similar result in alloys, to wit: cadmium from one to two parts, lead two

parts, tin four parts, possessing the properties and advantages described, and that may be used as a metallic cement and for other purposes, and to which also mercury may be added, as set forth, to modify the result for particular cases.

I also claim as a further application of the same principle, embodied in the production of the aforesaid alloy, the composition of matter or alloy consisting of from one to two parts cadmium, two parts tin, four parts lead, and seven or eight parts bismuth, or any modification thereof, as specified and indicated, so as to produce an alloy, as described, useful as a cement and for other purposes, as set forth, and to which also mercury may be added, as stated.

What I claim as new, in either case, is the specified improvement in alloys produced by using cadmium in the ratio and manner described, in combination with the metals specified, in the proportions thereof, substantially as set forth.

No. 27,591.—THEODORE BURR, of Hastings, Mich., assignor to himself, J. B. LORDELL, and A. PELHAM, of said Hastings, and H. BURR, of Allen, N. Y.—*Improved Machine for Cutting Files*.—Patent dated March 20, 1860.—The inventor says: I construct a metallic bed piece or frame work A with ways for a slide, or table marked B having fasteners C by which the blank file is firmly secured to the table; and also with ways for a pedestal D upon which I adjust the hammer and chisel and cutters and the spring to bear upon the hammer, the pedestal being so constructed as to receive a set screw E attached to the bed, by which means the force of the hammer is varied so as to cut the required depth in the file, by changing it more or less, in mesh with the tappets on the cylinder F.

Claim.—The use of the cylinder F, constructed as described, in connection with spring hammers, cutters, and file blank carriers; the whole operating in the manner and for the purpose described.

No. 27,592.—GEORGE COOPER, of Hartford, Conn., assignor to ALBERT BURGESS, of Windsor Locks, Conn.—*Improved Breech Clamp*.—Patent dated March 20, 1860.—This invention consists in making additional improvements in the "hold fast," as commonly used by cabinet makers.

Claim.—The arranging together of the shank *b*, arms *e*, pad *f*, with a proper fastening device as a screw *i*, substantially in the manner and for the purpose described.

No. 27,593.—JOSEPH J. COUCH, of Brooklyn, N. Y., assignor to JOSIAH S. SWAN, of New York City.—*Improvement in Sewing Machines*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, maintaining the needle thread of a sewing machine tight as the point of the needle penetrates the fabric, delivering out the necessary amount of thread for forming the loop and for the distension of the loop by the passage through it of the shuttle, maintaining the thread slack as the needle begins to rise, and finally drawing up the slack thread so as to complete the stitch by means of the lever G, or its equivalent, in combination with the washers and clamp, or other device for imparting the desired friction to the said lever; the latter being operated by the needle arm or other moving part of the machine, substantially as and for the purpose set forth.

Second. The stationary eye *k*, in combination with the lever G, or its equivalent, when the latter is arranged, applied, and operated substantially as set forth, and when the eye is made adjustable in respect to the lever, for the purpose specified.

Third. The combination of the lever G, applied and operated substantially as set forth, with the shuttle of the sewing machine, so that the said lever may yield slightly on the distension of the loop by the shuttle when more than the usual amount of thread is required for the stitch, as set forth and for the purpose specified.

No. 27,594.—L. W. LANGDON, of Northampton, Mass., assignor to himself, HIRAM WELLS and D. G. LITTLEFIELD, of said Northampton.—*Improvement in Sewing Machines*.—Patent dated March 20, 1860.—This invention consists in a peculiar revolving take up which is attached to the driving shaft, and operates independently of the needle bar, casts off the thread at the required moment to form the loop for the entrance of the shuttle, leaves the loop loose until the shuttle has passed through and then tightens up the stitch.

The inventor says: I *claim*, first, operating a four motion feed by means of a loose and a friction joint, substantially in the manner and for the purpose specified.

Second. I claim the revolving take up L, operating as set forth, for the purpose of governing the needle thread, as described.

Third. I claim the hook T, or other equivalent device, for the purpose of keeping the shuttle thread tight, as described, when used in combination with a needle driven by a crank, as set forth.

Fourth. And, in combination with a needle driven by a crank, I claim the rib *h*² in the shuttle race, with its notch or shoulder 3, for the purpose of preventing the loop from being carried forward by the shuttle, as set forth.

No. 27,595.—E. A. LELAND, of Jacksonville, Ill., assignor to himself and STEPHENSON & TOMPKINS, of said Jacksonville.—*Improvement in Gas Stoves*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: The combination, with the base B and cylinder A, of the gas box *a b c*, and supply pipe E, as shown and described, so that the device may be used as a cooking or air-heating stove at pleasure, as set forth.

No. 27,596.—DANIEL MINTHORN, of Beverly, Mass., assignor to JOHN A. GREENE, of said Beverly.—*Improvement in Enema Syringes*.—Patent dated March 20, 1860.—This invention consists of a thin hollow piece of metal, formed by punching, bending, or otherwise, with its smaller end of hemispherical shape, and its sides or remaining portion extended therefrom in such a manner as to form a comparatively large open mouth, the said sides or larger portion of the valve having one or more apertures.

Claim.—The hollow valve, constructed with a hemispherical end and having apertures or throats formed in its sides for the fluid to pass through, substantially as set forth.

No. 27,597.—WILLIAM H. NOYES, of Gardiner, Me., assignor to GIDEON S. PALMER, of said Gardiner.—*Improved Machine for Reducing Wood Slivers*.—Patent dated March 20, 1860. This invention consists in the employment, in front of the cutter, of a series of splitting knives, so arranged with reference to each other as to secure the surface of the bolt longitudinally, without so compressing the fibre as to cause it to bind upon the said knives and obstruct their operation.

Claim.—The combination, in a sliding stock O, of the cutter B and splitter C, made up of a series of knives in rows, so arranged that the posterior rows shall score the spaces left by the foremost row, substantially in the manner and for the purpose specified.

No. 27,598.—ELIZABETH KEAGY, of Mineral Point, Va., administratrix of SAMUEL KEAGY, deceased, late of said Mineral Point.—*Improved Centring Chuck for Lathes*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The sliding thimble or sleeve D fitted on the mandrel C, connected with a loaded lever E and provided with a flaring or funnel shaped outer end, concentric with the mandrel and its centre points *a*, to form a centring chuck for a lathe, as set forth.

No. 27,599.—HIRAM H. SCOVILLE and D. R. FRASER, of Chicago, Ill., assignors to themselves and P. W. GATES, of said Chicago.—*Improvement in Quartz Crushers*.—Patent dated March 20, 1860.—The quartz being placed in the concave at each end and a weight placed in the box F, a reciprocating motion is imparted to the trough; the movement of the trough causes the quartz to be carried back and forth under the roller, and consequently it is first broken into small fragments between the pyramidal teeth of the concave and circumferential ribs of the roller, and then by the water is forced toward the centre of the concave, where it is pulverized by the longitudinal ribs of the concave and circumferential ribs of the roller; after which it discharges with the water through the screens or grates.

Claim.—Crushing quartz by the combined agency of a swinging concave trough B and a rising and falling roller D, substantially as set forth.

No. 27,600.—C. EDWARD SNEIDER, of Baltimore, Md., assignor to THOMAS POULTNEY, of said Baltimore.—*Improvement in Breech Loading Fire Arms*.—Patent dated March 20, 1860.—This invention consists, first, in a certain contrivance applied to a locking spring for the purpose of constituting a means of adjustment to make the said spring lock the breech joint tightly and compensate for the wear of the said spring, and the projections on the breech and barrel upon which the said spring acts. It consists, secondly, in certain improved means of raising the locking spring from the projection on the breech to unlock it and permit it to be opened for loading.

The inventor says: I *claim*, first, the combination, with the locking spring D, of the wedge *e*, the spring *f*, and the set screw *h*, the whole applied and operating substantially as and for the purpose specified.

Second. The lever F, applied in combination with the trigger guard and with the pin *j*, substantially as and for the purpose specified.

No. 27,601.—JOHN STOWELL, of Charlestown, Mass., assignor to himself and DANIEL F. WHITE, of said Charlestown.—*Improved Feed Water Regulator for Steam Boilers*.—Patent dated March 20, 1860.—The object of this invention is to control the action of the feed pump, either by shifting a belt which drives it from a loose to a fast pulley, and *vice versa*, on one of the shafts by which it is driven, or by operating on any other means of starting and stopping the pumps.

Claim.—The combination, with the float B and steam box A, of the slotted rod *b*, arm I,

valve C, vessel G, lever H, or its equivalent, and a loaded lever J, the whole applied and operating substantially as described.

No. 27,602.—STEPHEN USTICK, of Philadelphia, Pa., assignor to himself and JULIUS A. PEASE, of New York, N. Y.—*Improvement in Clay Pipe Machines*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing the die piece J, with perforations or openings *t* to be filled with cotton, wool, or other equivalent substance, in combination with the band or wrapper Y, substantially as and for the purpose described.

Second. The grooves or channels *u* in the die pieces G and H, to be filled with cotton or other suitable fibrous substance, or an equivalent, in combination with the sheaths *v* and *w*, for the purpose of lubricating the lips of the dies, as described and shown.

Third. The combination of the springs with the core M, for the purpose of holding the latter in its place during the formation of the bell end of the pipe, substantially as described.

Fourth. Combining and arranging the ring *c* with the mould L and core M, substantially as and for the purposes set forth.

Fifth. The combination and arrangement of the bevel piece *h* with the adjustable sliding frame *i*, as and for the purposes described.

Sixth. The cut-off ring O², in combination with the shifting rod O, or its equivalent, when arranged and operating in relation to the die I, substantially in the manner and for the purposes set forth.

Seventh. The safety chamber T, provided with the valve U, arranged and operating in relation to the clay cylinder B substantially as and for the purpose set forth.

No. 27,603.—C. J. VAN WYCK, of New York, N. Y., assignor to JOHN M. MACAULEY, of said New York.—*Improvement in Apparatus for Distilling Oil from Coal*.—Patent dated March 20, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of a retort with a grate *c* in the bottom, and an inclined conductor E below such grate, as described, such conductor not being the outlet for the gaseous products of combustion of the fire by which the retort is heated.

No. 27,604.—A. L. O. WALL, GEORGE ROBERTS, and MILO S. CARTER, of Decatur, Ill.—*Improvement in Trucks for Mole Plough*.—Patent dated March 20, 1860.—This invention consists in supporting the beam upon wheels, the axles of which turn in bearings at each end of the beam, and are bent at their ends and in their centres, so that each wheel turns, as it were, upon a radius bar; it further consists in suspending the axle of the front wheels in an adjustable loop.

The inventors say: We *claim* the combination of the crank axles B B¹, link rods G, travelling plate F, and screwed spindle C, substantially as described, for the purposes set forth.

We also claim supporting the front axle in an adjustable bearing, when arranged and operating substantially as described, for the purpose set forth.

No. 27,605.—GEORGE W. N. YOST, of Yellow Springs, Ohio, assignor to G. W. N. YOST & Co., of said Yellow Springs.—*Improvement in Manufacture of Soap*.—Patent dated March 20, 1860.—The object of this invention is to prepare a powerful concentrated hard soap, convenient for transportation and readily convertible into soft soap and into suds by the addition of hot water.

Claim.—The described new article of manufacture, namely: hard soap, prepared in a state of minute subdivision, instead of bars or cakes, substantially as set forth, for the purposes described.

No. 27,606.—JAMES ADAIR, of Mendota, Ill.—*Improvement in Mole Ploughs*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of two extensions above claimed, and a hinge-like connection whereby the coulter and mole are flexible upon each other horizontally, independently of one another, and immovable upon each other perpendicularly, as and for the purposes set forth.

No. 27,607.—JAMES W. ADAMS, of Pleasant Valley, Vt.—*Improved Stave Machine*.—Patent dated March 27, 1860.—This invention consists in the employment of concave and convex tsationary knives, pressure rollers, and a reciprocating bed, operated in a novel way, and the whole arranged for joint operation.

Claim.—The reciprocating bed H, operated by the pinion G and a movable rack K, and the supplemental yielding and rigid beds Q T, in connection with the concave and convex knives R S and pressure rollers N O P P, all being arranged for joint operation, as and for the purpose set forth.

No. 27,608.—T. F. ALLEN, of Dyersville, Iowa.—*Improvement in Brackets for Railroad Car Trucks*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A suspension bracket D, which is capable of changing its bearing point, and which acts by reason of changing its point of bearing with a counteracting force against the lateral vibrations of the car body, substantially as and for the purposes set forth.

No. 27,609.—S. A. BAILEY, of New London, Conn.—*Improvement in Wringing Machines*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the rubber rollers B B with the oscillating guide board D, for the purpose of washing and wringing the clothes, and at the same time directing the course of the water pressed from the clothes into either tub, substantially as set forth.

No. 27,610.—JOHN S. BARDEN, of New Haven, Conn.—*Improvement in Steam Pumps*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and combination of a steam engine, a pump, two valve chests, and two slide valves, in manner and so as to operate substantially as described and represented.

I also claim the combination and arrangement of the secondary piston with the main pump piston, constructed tubular, and having appliances substantially as described, by which it may be either attached to the main pump barrel or to the secondary piston, substantially in the manner and for the purpose as specified.

I also claim the improved balanced valve and its chest, made substantially as described, in combination with the pressure chamber *t*, furnished with an elastic bottom *u*¹, and applied to the valve and chest essentially in the manner and to operate as explained.

I also claim, in combination with the steam cylinder piston, the pump piston and the sliding box of the crank of the driving shaft, the two separate crossheads or guides for such box, and screws, or equivalents, so applied to such crossheads as to enable them either to be drawn together or forced apart, in manner and for the purpose specified.

No. 27,611.—JAMES F. BECKWITH, of South Alabama, N. Y.—*Improved Hub for Carriage Wheels*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So constructing two metallic plates A A, which are provided with grooves *a a*, that they will clamp and hold the spokes separate and distinct from each other on their edges, while they are allowed to bear and press against each other on their faces, substantially as and for the purpose specified.

No. 27,612.—HARKNESS BOYD, of New York, N. Y.—*Improved Trap for Water Closets*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As a new article of manufacture, the trap or bend for water closet and other pipes, cast in half sections as specified, whereby the metal is formed of additional thickness at the joints and parts exposed to strain or wear as set forth.

No. 27,613.—ADOLPH BROWN and FELIX BROWN, of New York, N. Y.—*Improved Sugar Crushing Apparatus*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the arrangement of frames or plates, provided with knives or cutters on their underside, and hinged on one end to the frame of the machine, to produce an action similar to the blades of shears, in combination with a movable bed or carriage, for the purpose of cutting loaf sugar in small pieces, substantially as described.

We further claim the arrangement of two or more cutter frames, with their corresponding movable tables combined together, and situated behind or below each other, and giving to the latter a quicker motion than to those situated before them, substantially in the manner and for the purpose set forth.

No. 27,614.—WILLIAM BUSHNELL, of Easton, Penn.—*Improvement in Cultivators*.—Patent dated March 27, 1860.—A is a beam, to the back part of which a plough *a* is attached; B B are two beams, having similar ploughs *b b* attached to their back ends. These beams are connected by the joints *e* to the ends of the bars C C, which pass loosely through the beam, and are pivotted to it at about their centres. The bars are allowed to turn in the beam, the mortises through which they pass being sufficiently long to allow it. In the outer part of the beam A, a pulley D is fitted horizontally. This pulley has a toothed periphery, and a chain E passes around its outer side, the ends of said chain being attached to the front ends of the beams B B.

Claim.—The arrangement of the central beam A, movable bars B B, pivotted connecting bars C C, adjustable chain wheel D, chain E, and ploughs b, as and for the purpose shown and described.

No. 27,615.—M. L. BYRN, of New York, N. Y.—*Improved Corkscrew.*—Patent dated March 27, 1860.—This invention consists in combining with the gimlet screw a T handle, and forming the handle and screw in one piece or in two.

Claim.—The combined gimlet screw and handle formed in the manner and for the purposes described as a new article of manufacture.

No. 27,616.—CULLEN CASEY, of Goldsboro', N. C.—*Improvement in Cotton Cultivators.*—Patent dated March 27, 1860.—In the construction of this invention A is the beam, which is constructed of two pieces, and is attached by means of the bolt c and band e, for the purpose of enabling the mule or horse to walk on either side of the row, as may be desired. A¹ is the stock, a the handles, B the scraper, C the screw bolt connecting the front of the scraper with the beam A, b the bolt passing through screw bolt C. The scraper B is attached to the frame d.

Claim.—The arrangement of the beam A, scrapers B, groove B¹, and bolt G, with stock A¹, the whole constructed and operating as described, for the purposes set forth.

No. 27,617.—GEORGE E. CHENOWETH, of Baltimore, Md.—*Improvement in Harvesters.*—Patent dated March 27, 1860.—The claim and engravings give an idea of the nature of this invention.

The inventor says: I *claim*, first, the laterally adjustable arm G, pivotted to the frame, as described, for the purpose of changing the position of the inner end of the finger bar laterally in relation to the main frame, to facilitate the folding of the bar to the outside of the wheel, as set forth.

Second. The combination of the trunnion piece H and hinge piece I, with the arm G, pivotted as specified, for the purpose described.

Third. The adjustable side braces J, hinged to the frame, and operating substantially in the manner described.

Fourth. The finger bar, constructed of a tube or rod, in combination with the shanks or sockets of the fingers secured thereon, substantially in the manner described.

No. 27,618.—GEORGE COLLYER and A. HAMILTON PATTERSON, of Philadelphia, Pa.—*Improved Paddle Wheel.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The sliding paddles D, shaped and arranged so that each paddle enters the water with a point, and as it enters presents a surface which gradually widens until the full breadth of the paddle is presented to the water, in combination with an eccentric track, secured to the side of the vessel on the inside of the space occupied by the wheel, as and for the purpose shown and described.

No. 27,619.—BALDWIN DAVIS and J. M. SCROGGIN, of La Grange, Ga.—*Improvement in Ploughs.*—Patent dated March 27, 1860.—A represents the handles; B the standard that supports the handles; C the shank or standard of the plough, with notches D in front for the purpose of adjusting and regulating the depth of the plough; E is a wedge to secure the standard firmly to the beam; F is a metallic plate placed on the upper side of the beam to form a durable catch for the indentations and notches D in the metallic shank C.

Claim.—The combination of the beam L, plate F, shank C, notches D, and wedge E, with the adjustable brace G, subsoil point I, and adjustable mould board J, the whole being constructed and arranged as and for the purpose described.

No. 27,620.—JAMES DAVIS, of Fayetteville, N. C.—*Improved Sewing Machine Stitch.*—Patent dated March 27, 1860.—This machine makes a stitch in the forward and also in the backward stroke of the shuttle; thus there is need of two loopers, as one is used when the shuttle is on one side and the other used when the shuttle is on the other side; the operation of one looper being required to form each stitch, hence the loopers alternate.

Claim.—The formation of the knot stitch, as represented in Fig. 3, substantially as described.

No. 27,621.—WILLIAM FRANK DEAN, of Baltimore, Md.—*Improvement in Saddles.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The side adjustable pommel B, or its equivalent, in combination with a gentleman's saddle, for the purpose of converting the same into a ladies' saddle, substantially as set forth.

No. 27,622.—I. H. DOOLITTLE, of Ansonia, Conn.—*Improved Pipe Wrench*.—Patent dated March 27, 1860.—This invention consists in the use of a sliding box or sleeve, placed in the shank of the implement and provided with a tooth in connection with a rack formed at one edge of the shank, and an eccentric formed at the end of a hook which is attached to the sliding box or sleeve.

Claim.—The combination of the rack C, on the shank A, the sliding bar or sleeve D, fitted on the shank with tooth b, and hook E attached, the latter having an eccentric d formed on its inner end, all being arranged to operate as and for the purpose set forth.

No. 27,623.—JOSEPH L. DUTTON, SR., of Philadelphia, Pa.—*Improvement in Hoisting and Weighing Machines*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the hoisting and lowering apparatus composed of the barrel D, the brake wheel H, and brake strap I, the latter being connected to one end of the hoisting rope F, and to the lever M, or its equivalent, in combination with the ratchet wheel W, and spring pawl x, the whole being arranged and operating substantially as set forth, so that the application of the brake for the retention of the weight in the position to which it has been hoisted is independent of the weight itself, as specified.

Second. The bar P, when connected to the hoisting rope F, and to the graduated lever V, substantially in the manner and for the purposes set forth.

Third. The sliding link Q, operated by the lever S, or its equivalent, and combined with the lever P, hoisting rope F, and brake strap I, substantially as specified, so that the operating of the brake strap and throwing in and out of gear of the weighing apparatus may be accomplished simultaneously by raising or lowering the said link Q, as specified.

No. 27,624.—DIEDRICH FEHRMAN, of Liverpool, England.—*Improvement in the Manufacture of Resin*.—Patent dated March 27, 1860.—This invention consists of a process for the production of an improved resin. In making this improved article the inventor says: I take common crude turpentine and place it in a room heated by steam or fire to a temperature of not more than one hundred degrees Fahrenheit, and then cause it to pass through a sieve made of copper wire tinned, or other suitable strainer; from this sieve or strainer it falls into another strainer of so fine a texture as to thoroughly remove all the mechanical impurities mixed with it. During this process the crude turpentine is not allowed to exceed the temperature above named.

Claim.—The combined process described, having for its object the manufacture of resin, as set forth.

No. 27,625.—LEVI FERGUSON, of Lowell, Mass.—*Improved Steam Trap*.—Patent dated March 27, 1860.—This invention consists in a novel arrangement of the valve, the diaphragm and the chamber relatively to each other and to the escape pipe, whereby the valve is rendered more sensitive and a freer escape for the water and sediment is provided than in most other steam traps.

Claim.—The arrangement of the annular chamber H h, in combination with the valve and diaphragm, substantially as described, for the purpose set forth.

No. 27,626.—EZEKIEL GROSS, of Goshen Hill, S. C.—*Improvement in Subsoil Ploughs*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the furrow plough and subsoiler, the curved brace uniting the beam, the standards, and the handles together, and when the subsoiler is made adjustable on the brace and beam, substantially in the manner and for the purpose set forth and explained.

No. 27,627.—CYRUS M. HALL and DAVID E. HALL, of Uniontown, Ill.—*Improvement in Cultivators*.—Patent dated March 27, 1860.—This invention consists in so constructing and arranging the several parts as to enable one person to guide the cultivator while he also drives the team.

Claim.—The general arrangement and combination of the revolving coulter with knife-edged arms, the shovels A made with flukes or barbs, the beams B B, the cross bar X, straps S, rollers r r, treadles P P, and the pin or pivot on which the beam B hangs, all connected as described and for the purpose set forth.

No. 27,628.—R. K. HAWLEY, of Baltimore, Md.—*Improved Construction of Circular Saws*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A circular saw consisting of segments and backing plates constructed and united as described, and attached to the central flange, substantially in the manner set forth.

No. 27,629.—HENRY W. HERBERT, of Herbertsville, Va.—*Improvement in Marine Propellers*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, adapting the outer form of the submerged portion of a vessel and the surface of the body of a propeller to each other, so that both together shall form a continuous outline, and at the same time only a portion of the propeller be exposed to the water, the other portion being enclosed within the body of the vessel, substantially as and for the purposes set forth.

Second. Providing each side of the ship with a curved shield H, in combination with a system of braces E E D C, for the purpose of protecting the propeller blades and of bracing together the main body of the ship and that portion of it which is behind the propeller, substantially as and for the purposes set forth.

Third. The application, in a propeller such as described, of the removable blades J, the tongues O of the blades fitting into dovetail grooves in the surface of the body of the propeller, substantially as and for the purposes set forth.

Fourth. Constructing the main side braces P of the ship so that they may be used as coal bunkers, substantially as and for the purposes set forth.

No. 27,630.—JESSE HANON, JR., of Taylorsville, Ill.—*Improvement in Drain Ploughs*.—Patent dated March 27, 1860.—A represents the beam of the plough, which is adjustable. Near the end of this beam a cutter or coulter C is secured which extends downwards, and is provided at its lower end with a mole D. The object of making the cutter adjustable, so that it will turn upon a centre like a rudder, is to guide the mole in any direction the operator may desire.

Claim.—The combination and arrangement of the rod E, coulter C, and slides G G¹, with the beam A and rod B, substantially as and for the purpose specified.

No. 27,631.—N. HOAG and WILLIAM H. TAPPEY, of Petersburg, Va.—*Improvement in Tobacco Screws*.—Patent dated March 27, 1860.—This invention consists in the construction of two plates with slots and key, for the purpose of supporting a heavy lever in tobacco press screws.

Claim.—The arrangement of the several parts combined as constituting the specific machine, for the purpose shown and set forth.

No. 27,632.—SAMUEL HOAKE, of Frederick, Md.—*Improvement in Cultivators*.—Patent dated March 27, 1860; antedated March 9, 1860.—This invention consists in having on the back part of the frame a shaft or bar extending across it, on which the shovels are jointed by the shaft passing through their eyes.

The inventor says: I *claim*, first, the combination of the jointed shovel shaft B, slotted shovels T T¹, drag bars D and d, shafts S, straps b, spring detent e, and guides g, substantially as described.

Second. In combination with the foregoing I claim the adjustment of wheels W on axle A by bolt a and pins i, as specified.

No. 27,633.—J. L. HOVEY, of Lockport, N. Y.—*Improvement in Pulley Blocks*.—Patent dated March 27, 1860.—This invention consists in projecting up from the top of the fixed double pulley blocks a hook having an eye in its end, into which is hooked a collateral block with one pulley or sheave, and over this sheave the draw or full rope is passed, leading from the movable block; the fixed pulley blocks are hung up by a swivel hook which hooks under the fixed block hook.

Claim.—The peculiar method of having blocks A D both being suspended from one hook and kept in an upright position by a projection H of the collateral block, thus obviating the friction occasioned by the pulleys getting twisted out of an upright position, as above described.

No. 27,634.—GEORGE W. HUNT, of Muscatine, Iowa.—*Improvement in Ploughs*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of a vertical coupling and adjusting pin I, which has that portion, which passes through the beam, round, and that portion, which passes through the axle, square, in combination with a diagonal adjusting bar P, a connecting rod N, and a vertical lever O, substantially as and for the purpose set forth.

Second. The arrangement of a long slot W in the axle, with an upper and under slotted sliding plate L L¹, and the coupling and adjusting pin I, substantially as and for the purposes set forth.

Third. The arrangement of the beam A, slotted axle D, coupling pin I, slotted plate L L¹, diagonal connecting rod V, adjusting bar P, lever O, driver's seat C, treadle M, plough F,

horizontal rotary land side wheel G, and rotary coulter H, in the manner and for the purposes set forth.

No. 27,635.—A. B. HUTCHINS, of Quincy, Fla.—*Improvement in Seeding Machines*.—Patent dated March 27, 1860.—The operation is as follows: The hopper G is supplied with seed, and as the implement is drawn along motion is given to said hopper through the medium of the teeth *b* and the arm J, in connection with the gravity of the hopper. The rod *e*, with its projections *g g*, cause the seed to pass uniformly out through the spout *d* of the hopper into the spout H.

Claim.—The vibrating hopper G, in connection with the agitator or clearer H¹ attached to the front part of the spout H and passing within the hopper and clearer, being arranged relatively with the spout H, substantially as and for the purpose set forth.

No. 27,636.—EDWIN JONES, of Chester Cross Roads, Ohio.—*Improvement in Harvesters*.—Patent dated March 27, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I claim hinging the frame E to the inside of the main frame, within the periphery of the wheel B¹, in combination with hinging the front to the main frame by the coupling arm M, substantially as and for the purposes set forth.

Second. The raker's seat D¹, arranged in relation to and combined with the main frame A A and frame E, substantially as and for the purposes set forth.

Third. The inclined plane *l*, in combination with the heel of the cutter bar, substantially as set forth.

No. 27,637.—FRANK G. JOHNSON, of Bellwood, Sag Harbor, N. Y.—*Composition to Prevent the Depredations of Insects*.—Patent dated March 27, 1860.—This invention consists in attenuating coal tar by coating with it common sand or saw dust, and afterwards rolling the sand or saw dust so coated in earth, ashes, lime, or guano, sufficiently so to deprive the coal tar of its adhesive or sticking properties.

Claim.—The composition and mode of attenuating coal tar or tar with sand or saw dust, and afterwards the coating of the sand or saw dust so tarred with earth, ashes, slaked or ground lime, plaster or guano, substantially in the manner and for the purposes described.

No. 27,638.—SAMUEL JOHNSTON, of West Shelby, N. Y.—*Improvement in Corn Huskers*.—Patent dated March 27, 1860.—This invention consists in making a hand corn husker, which is held and operated by one hand, in a manner similar to the operation of a pair of sheep shears, while the corn to be husked, either when picked or in stocks or standing on the hill, is held by the other hand.

Claim.—The corn husker herein described, consisting of fingers A B, crossbar E, knife D, and spring S, constructed and arranged to operate in the manner and for the purposes specified.

No. 27,639.—ALBERTUS LARROWE, of Cohocton, N. Y.—*Improvement in Self-acting Carriage Brake*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and relative arrangement of the rubber Z and swinging brake arm C¹ with the end of the brake bar V, whereby the strain upon the rubber Z is borne principally by the rigid end of the brake bar, directly in front of the periphery of the wheel, and not by the hinge of the rubber, substantially as shown and described.

No. 27,640.—JOHN B. LOGAN, of Blountville, Tenn.—*Improved Andiron*.—Patent dated March 27, 1860.—This invention consists in arranging the andiron with a bottom plate or frame, in combination with two upright angular bars, in such a manner that the same stands firmly in its place and allows a free circulation of the heat.

Claim.—The arrangement of the bottom frame A, or its equivalent, in combination with the angular bars B, or their equivalents, constructed and united substantially as and for the purpose described.

No. 27,641.—F. T. LOMONT and JOHN GROJEAN, of Masillon, Ohio.—*Improvement in Reaping and Mowing Machines*.—Patent dated March 27, 1860.—By turning down the lever J, the cord *a* draws the cutting apparatus up from the ground, so as either to regulate the height of cut or to raise it above obstacles in removing it from one point to another. By means of the bars D and C, the cutting apparatus may be inclined up or down for mowing or reaping or for adapting it to uneven ground just as circumstances may require.

Claim.—The arrangement of the hinged frame, consisting of the braces B B, and cross-

piece *e*, in combination with the segmental adjustable frame C, levers D and J, and chain *a*; all the parts constructed and applied in the manner and for the purpose specified.

No. 27,642.—PELLS MANNY, of Waddams Grove, Ill.—*Improvement in Harvesters*.—Patent dated March 27, 1860.—As the machine is drawn along, the rod D has a compound movement given to it by the wrist pin *a*, its slotted connection with lever E, and the friction roller *h*, which latter serves as a bearing for the rod, and causes its outer or back end to fall simultaneously with the rising of its front end. This movement of the rod D gives an intermittingly rising and falling movement to the lever E. The lever as it rises elevates the rake F, which is vibrated or moved over the surface of the platform I, by the rod G, the latter receiving its motion from the rod D.

Claim.—The arrangement of the wrist pin *a*, rod D, slotted as shown, and connected with the lever E, the friction roller or bearing *h*, and connecting rod G, arranged for joint operation as and for the purpose set forth.

No. 27,643.—ROBERT MCCAIN, of Rootstown, Ohio.—*Improved Washing Machine*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In a washing machine constructed substantially as described, the arrangement of levers and hand and foot bars of the pounding and of the rubbing parts of the machine, in their relation to the rubber and the pounder, and in their relation to each other, whereby the operator may move the pounder and the rubber by the foot and hands together, or by the hands alone, as set forth.

No. 27,644.—THOMAS B. MCCONAUGHEY, of Newark, Del.—*Improvement in Seed Planters*.—Patent dated March 27, 1860.—This invention consists in an arrangement whereby the operator is enabled to see the seed discharged, and also to cause the same to be properly distributed in the hills.

Claim.—The slide *f*, provided with the opening *g*, and the seed box A, with the partition *l*, arranged relatively with the slide and its opening *g*, as shown, in connection with the opening *d*, in the end piece *a* of the seed box, and the projection or scatterer *c* thereon, and the strip *m* on the seed box; all arranged for joint operation, substantially as set forth.

No. 27,645.—SAMUEL MCGREGOR, of Logansport, Ind.—*Improvement in Car Seats*.—Patent dated March 27, 1860.—This invention consists in having two backs attached to each seat, and connected by gearing, and having the upholstery connected with certain automatic mechanism, so arranged, that the backs may be more or less inclined and correspondently increased in height as desired, one being used as a support to the lower extremities of the occupants, and either used as a back, as occasion may require.

Claim.—The backs B B, attached to the seat A, and connected by the gearing E F, in connection with the stop N, arms or levers H, rods I, and slides J, connected to the bars D, of the backs and provided with the rollers K K¹, the seat and backs being provided with the continuous cushion L, passing around the rollers K K¹, with its ends attached to the backs B; all being arranged substantially as and for the purpose set forth.

No. 27,646.—HENRY NAPIER, of Brooklyn, N. Y.—*Improvement in the Manufacture of Resin*.—Patent dated March 27, 1860.—The still is arranged with two heads, so planned that either of them may be removed and the orifice closed when the other is in use. One of these heads is connected with a condensing worm or any efficacious form of condenser, the other with a receiver by a plain pipe. The still is heated by fire, or in any way by which a heat of about six hundred degrees Fahrenheit can be obtained, that is about the boiling point of oil. Passing into the still and forming a coil at its bottom, is a steam pipe connected with a boiler, and pierced so far as regards its coil, with small holes for the passage of the steam.

Claim.—The within described method of producing white resin at one continuous operation, substantially as set forth.

No. 27,647.—A. S. NOTESTEIN, of Salem, Iowa, assignor to L. J. ROGERS, of said Salem. *Improvement in Seeding Machines*.—Patent dated March 27, 1860.—The operation is as follows: The rollers B B break the clods and level the ground. A spout, which is placed under each seed box, follows and makes a furrow. The operator, by means of his feet, rocks the foot piece *a*, which communicates motion to the seed slide F, by the lever E, thus the seed are distributed in the desired places, while the coverers H H follow and cover the grain.

Claim.—The arrangement of the foot piece *a*, the rocking standard *d*, the lever E, and the seed slide F, with the rollers B and C, and coverers H H, when the several parts are connected and used substantially as and for the purpose specified.

No. 27,648.—JACOB NUESSELY, of Gowanda, N. Y.—*Improvement in Composition for Tanning Leather*.—Patent dated March 27, 1860.—This composition consists of pyroligneous or wood acid, and wood tar mixed with water, and a small quantity of muriatic acid, and with alum and catechu (japonica,) or some other substance which facilitates the tanning process, such as common bark liquor.

Claim.—The employment, for the purpose of tanning, of a composition consisting of the ingredients herein specified, and mixed together in about the proportions described.

No. 27,649.—E. T. ORNE, of Boston, Mass.—*Improvement in Gas Regulators*.—Patent dated March 27, 1860.—This invention consists in the employment of saw dust or wood filings as the filtering medium, and in a gas burner having the required facilities for adjusting the compression of the filtering medium.

The inventor says: I *claim* the employment of sawdust or wood filings as a filtering medium for gas burners.

I also claim, in combination with the use of said material, the above described burner, consisting essentially of the cylinder A, and ring f, operating substantially as set forth.

No. 27,650.—E. H. PHILO, of Halfmoon, N. Y., assignor to CHARLES E. PEASE, of Albany, N. Y.—*Improvement in Cider Mills*.—Patent dated March 27, 1860.—The apples being placed in the hopper K, and the levers D D moved up and down, the slice cuts them into strips, which passing down between H and J, upon C, are swept by its teeth right and left through the teeth a a, where they are torn into small shreds, which falling down between the rollers C, and the quadrants G, are thoroughly squeezed and pass down in juice, and their thin pomace into the trough T, fixed upon the bottom of the frame.

The inventor says: I *claim*, first, the cylinder C, operating with a liberating movement in connection with quadrants E and G, and with its teeth arranged to coöperate with teeth a a, affixed to partitions H and J, substantially as described and for the purpose set forth.

Second. The slicing apparatus S, operating as set forth, in combination with the cylinder C, and its coöperative apparatus as described, in the above specification.

No. 27,651.—WILLIAM R. SAUNDERS, of Buena Vista, Miss.—*Improvement in Ploughs*.—Patent dated March 27, 1860.—The beam A, handles B, braces C D and I, are of the usual form and construction. There are two ploughs attached to the beam, one on each side, for ploughing on both sides of the cane, corn, or cotton at the same time, by means of the perpendicular standards or rods I, secured to the landside or bar M, which pass through a perforation in the share, and are secured to the yoke E on the beam by means of screws or nuts. Each plough consists of a share F, mould board H, coulter G, and landside or bar M.

Claim.—The combination and arrangement of the shares F F, coulters G G, and movable mould boards H H, with beam A, handles B B, yoke E, and oblique brace K; the whole being constructed for operation as described.

No. 27,652.—J. F. SCHUFFENECKER, of Keokuk, Iowa.—*Improvement in Brick Moulds*.—Patent dated March 27, 1860.—The inventor says: Place the moulds upon the drying floor without shaking, reverse the lock bar O, push the cross parts of the levers D towards the ends of the moulds, take hold of the handle of the moulds, and deliver the bricks; put the moulds upon the drying floor at the rear end of the bricks, reverse the lever D, and secure it by the lock bar O, and the mould is ready to be sanded and filled.

Claim.—Operating the bottoms of the moulds by means of the lever D, rod F, wedges J J o, cogs I I o, slide K, and lock bar O, in the manner and for the purpose specified.

No. 27,653.—ROBERT T. SMART, I. W. SMART, and A. I. SMART, of Troy, N. Y.—*Improvement in Manufacture of Straw Paper*.—Patent dated March 27, 1860.—This improvement will be understood from the claim. A detailed description would require too much space to be given here.

Claim.—The method specified of treating straw or similar vegetable fibre for making white paper by the successive operations of boiling, washing, and separating or beating, and then applying the chemicals used for bleaching to the pulp, substantially as set forth.

No. 27,654.—GEORGE SMITH, of Baltimore, Ohio.—*Improvement in Cultivators*.—Patent dated March 27, 1860.—The chains or ropes I I are fastened to the front side of the teeth F F, and also to the roller J, which is arranged to turn in brackets fastened to the axle B and to the hounds D D, and has the lever K fastened in it, so that by raising the lever and winding up the ropes they raise the points of the teeth.

Claim.—The arrangement of the hinged teeth F, shanks G, ropes or chains I, roller J, and lever K; the whole being arranged for joint operation as described, for the purposes set forth.

No. 27,655.—S. F. VAN CHOATE, of Yreka, Cal.—*Improved Magnetic Telegraph*.—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in combination with the escapement which controls the operation of the mechanism which drives the type wheel of the two electro-magnets E E, arranged in the same circuit, a permanent magnet G, combined with one of such electro-magnets as described, and the two armatures E¹ F¹, attached to a lever so applied relatively to the said magnets and escapement as to be operated substantially as described, to control the escapement by the opening and closing of the main or through current of a line of telegraph.

Second. I claim the employment, in combination with the electro-magnet W of the printing circuit, and the permanent magnet V, that is combined therewith, of a circuit breaker, composed of a ratchet toothed wheel 42, and lever 41, or their equivalents, applied and operating substantially as described, to cause the opening of the printing circuit while the type wheel is in motion, and the closing of the said circuit on the stoppage of the type wheel, substantially as described.

Third. I claim combining the lever which carries the armature of the printing magnet with the printing mechanism by means of a notched wheel Y, sliding bolt 52, cam 56, and spring 60, attached to said wheel, and a stop pawl 50, or their equivalents; the whole applied and operating substantially as described, to cause the unlocking of the mechanism, which brings the printing roller into operation on the stoppage of the type wheel, and the relocking of the said mechanism after the printing operation.

Fourth. I claim the employment, in combination with each other and with three separate branches of the same main circuit, of a key O, an intermitting wheel J, a check plate K, and a system of magnets E F G; the whole operating together substantially as described, for producing the synchronous operation of all the type wheels on a line of telegraph, and effecting the stoppage thereof in a position to present to their respective printing apparatus the letter corresponding with the depressed key.

Fifth. In combination with the key, intermitting wheel, check plate, and system of magnets, and the three separate branches of a main circuit as described, I claim the printing circuit breaker, and the branch circuit, longer than the printing circuit, formed by the coiled wire 14 or its equivalent; the whole operating as and for the purpose specified.

No. 27,656.—WILLIAM TALLMAN, of Providence, R. I.—*Improvement in Horse Shoe Nail Machines*.—Patent dated March 27, 1860.—The object of this improvement is to make the heads of the nails as large as are required, by constructing, arranging, and operating the parts connected with making the head in such a manner as to form a case or mould, enclosing the end of the blank and heading punch on all four sides, so that as the punch advances in the case to the head of the nail by upsetting the end of the blank the metal will be completely confined within the case.

Claim.—The top die, performing the two functions of discharging the nail and forming the top of the case, in combination with the stationary cutter, movable cutter, and bottom die; the said bottom die having its face extended to a suitable distance, and in proper form for the underside of the case, all arranged and operated substantially as described.

No. 27,657.—JAMES TEACHOUT, of Waterford, N. Y.—*Improved Die Stock*.—Patent dated March 27, 1860.—The inventor says: In order to produce a die stock, I simultaneously and equally slide the three dies c c^1 c^2 toward the centre in the body D of the stock, by means of a screw e fitted to turn in the stock and press against a follower f which bears against the back end of one die c , and also forces inward two other followers g g^1 against the back ends of the two other dies c^1 c^2 , the stock D being constructed and the dies and followers held therein by a removable cover h formed and arranged so as to be moved by the screw.

Claim.—The combination of the screw e and followers f g g^1 with the dies c c^1 c^2 and stock D, constructed and arranged substantially as set forth.

No. 27,658.—SAMUEL D. TILLMAN, of New York, N. Y.—*Improved Mode of Making Pavement*.—Patent dated March 27, 1860.—The nature of this invention is explained by the claim and engravings.

Claim.—A pavement whose surface is composed of alternate elevations and depressions substantially equal in number and surface, and nearly rectangular, the depressions being only long enough easily to admit either cork of the horse shoe, all their sides nearly vertical and the longest sides nearly crosswise of the street, thus giving sure foothold at the shortest possible intervals, while the wheel runs smoothly upon the elevations without falling into the depressions, as described.

No. 27,659.—MARK SNOW, of Auburn, Miss.—*Improvement in Cotton Cultivators*.—Patent dated March 27, 1860.—This invention consists in attaching two scraping mould boards d to the front part of the body of the plough in such manner that one shall travel on each side of the row to scrape the ridge and throw the scrapings into the centre of the furrow, where they

will be covered by the earth thrown upon them by the rear parts of the scraping mould boards; two hilling mould boards *e* are secured to the rear of the frame, and are so arranged as to cut deeper than the scraping mould boards and to throw the earth inwards upon the plants after the ridge has been scraped; shield plates or fenders *g* are secured to the rear end of the plough beam and project downwards on each side of the row.

Claim.—The combination of the scraping mould boards *d*, hilling moulds *e*, and fenders *g*, when arranged and operating substantially as described.

No. 27,660.—C. W. WAILEY, of Lexington, Ky.—*Improvement in Ties for Cotton Bales.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The lugs *a*, in combination with the spaces *b* formed at the edges of the loop and extending any required distance from the ends, so as to unite and form a tie, substantially as set forth.

No. 27,661.—EDWARD B. WEAKLEY, of Pana, Ill.—*Improvement in Seeding Machines.*—Patent dated March 27, 1860.—This invention consists in the employment or use of seed distributing devices and share frames attached to a metal frame and so arranged that seed may be planted in hills or drills, and the ground also pulverized and freed from weeds, the machine being used for either purpose separately, as may be required.

Claim.—The swinging frame *G*, provided with the seed distributing devices, expanding and vertically moving bars *k k*, and shares *h¹ j¹*, and attached to the mounted frame *A* by joints or hinges *h* at its front end, and by the chains or cords *r s* and bar *F* at its back, all being arranged as and for the purposes specified.

No. 27,662.—R. A. WILDER, of Schuylkill Haven, Pa.—*Improvement in Feed Water Apparatus for Locomotive Engines.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement, substantially as shown and described, in connection with the feed and overflow pipes and pump, of a two-way cock, so that while a constant circulation of water is maintained in said pipes, only such portion thereof as may be desired shall enter the boiler, all as set forth.

No. 27,663.—SETH D. WOODBURY, of Lynn, Mass.—*Improved Reclining Chair.*—Patent dated March 27, 1860.—This invention consists in uniting the arms *D* and *G* by means of the connecting rod *F*, one end of which is provided with a thumb screw *f* that slides over a slotted piece *E* attached to the under side of arm *D*, by means of which arrangement the chair can readily be confined by the person sitting in it in any desired position or degree of inclination; also in the arrangement and combination of the folding legs *A A¹* and jointed strips *H* and *I*, with the other parts of a reclining chair, so that it can be readily folded up.

Claim.—The combination and arrangement of the arms *D* and *G*, seat *B*, slot *e*, connecting rod *F*, set screw *f*, supporting arms *J*, and leg rest *K*, with the folding legs *A A¹* and jointed strips *H* and *I*, substantially as set forth and for the objects specified.

No. 27,664.—JOSEPH D. BILLINGS, of Rutland, Vt., assignor to himself and E. A. KEENE, of Chapin, N. H.—*Improved Speed Register.*—Patent dated March 27, 1860.—The nature of this invention will be understood by the claim and engravings.

The inventor says: I claim, first, the arrangement of the circular rack *D*, actuated by any suitable governor, pinion *d*, stem *e*, and index heads *f g*, the latter having a pin *h* projecting from it, by which it is moved over the surface of the dial plate, when the same are combined in the manner and operated as set forth.

Second. I claim, in combination with the striker *k* on the rack *D*, the levers 1 2 3 4 and pawls *l*, ratchet wheels 1¹ 2¹ 3¹ 4¹, (more or less, as may be desired,) with their pins *U*, rods *H*, with their arms, the whole arranged and combined essentially as represented and described.

Third. I claim the wheel *N*, with its lever and pawl receiving a direct motion from the spindle *A*, arranged in such a relation to the point or needle *S²*, that said needle will register every mile passed over by the train of cars, as described; and, in combination therewith, I claim the spring rod *M*, pawl *R*, ratchet wheel *R¹*, and spool *L¹*, for moving the strip of paper upon which the speed and miles are registered at each revolution of the wheel *N*; all arranged in the manner and for the purposes set forth.

No. 27,665.—PHILOS BLAKE, of New Haven, Conn., assignor to BLAKE BROTHERS, of said New Haven.—*Improved Corkscrew.*—Patent dated March 27, 1860.—This invention is a new and improved manufacture of cork extractor, as made not only with a lever head applied to its lifting screw, but with a lever screw nut applied on such screw and to the cap of the neck

stand, in such manner that it may rotate and screw on the lifting screw and either rotate against or within the said cap.

Claim.—The improved cork extractor, as made with a lever head D affixed to its lifting screw C, and with a lever screw nut E applied to such screw C and to the cap of the neck stand, substantially as described and represented in the accompanying drawings.

No. 27,666.—THOMAS B. DE FOREST, of New York, N. Y., assignor to himself and WALLACE & SONS, of Ansonia, Conn.—*Improvement in Lanterns.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* connecting the ends of the vertical guard wires to the top and bottom portions of the lantern, by bending them into such form as to interlock with said top and bottom parts and be secured thereto by encircling or keying bands, or their equivalents, substantially in the manner set forth.

I also claim so bending the vertical guard wires as to form in them eyes, as described, in combination with the encircling horizontal guard wire passing through the said eyes, the whole constructed and operating substantially as specified, for the purposes set forth.

I also claim arranging the encircling guard wire *p* in such manner as to be capable of sliding circumferentially in its bearings in the vertical guards, in combination with the coupling nut *c*¹, so connected with said guard *p* that by turning it the said guard wire may be distended or contracted, substantially as set forth, for the purposes described.

I also claim, in combination with the top cap of the lantern and handle, the connecting link *o*, so formed of a single piece of wire as to effectually connect or couple the lantern cap to the handle and properly support the protector without the aid of any coupling pin or other auxiliary part, as hereinbefore explained.

I also claim forming in the handle, when made of flat metal, a loop *e* to operate in connection with the upper end of the link *o*, as specified, for the purpose set forth.

No. 27,667.—ROBERT W. GERAGHTY, of Newark, N. J., assignor to himself and WILLIAM M. SIMPSON, of said Newark.—*Improved Ventilating Spring Mattress.*—Patent dated March 27, 1860.—A is the frame; *b b* are spiral springs; *c c* is a cord passing around the frame A and secured on each side thereto, and securely attached, above and below, to the top and bottom of the springs *b b*. The cords *c c* and *d d* hold the springs *b b* in their appropriate position and ready at all times for action on either side, and from above or below, while the same cords also sustain the said springs, at all times, in exact and approximate relation to the frame A.

Claim.—The combination and arrangement of the frame A with the springs *b* and cords *c* and *d*, sack E, hair K, and outer cover *m*, substantially as and for the purposes specified.

No. 27,668.—HENRY HEWITT, of San Francisco, Cal., assignor to W. A. SANFORD, of Pottsdam, N. Y.—*Improvement in Seeding Harrows.*—Patent dated March 27, 1860.—The object of this invention is to obtain a rotary harrow, which may be used alone, or with a seeding machine, and be adapted for operating at a greater or less depth in the earth, as the nature of the earth may require.

Claim.—The arrangement of the axle A, bars *h h*, shaft *g*, cylinders *i i*, bearing *j*, arm *k*, holes *l l*, wheels B B, pendants *d d*, frame C, castor wheel D, seed boxes E E, and slide F, as and for the purpose shown and described.

No. 27,669.—JAMES HOTCHKISS, of Yellow Springs, Ohio, assignor to himself and E. P. H. CAPRON, of said Yellow Springs.—*Improvement in Drain Tile Machines.*—Patent dated March 27, 1860.—The die plates D D are hinged at their lower edges to the block *d*, or bottom of the vessel as at *h h*, so that they may be turned down. As the tile thread is produced, it is received upon an endless belt or apron, and moving in a horizontal or nearly horizontal position. The tiles are cut off by a fine wire stretched upon a frame, which passes quickly down, and cuts off the continuous tile thread.

Claim.—The combination and arrangement of the spiral wings *h h*, situated on the pug mill shaft, the wedge-shaped dividing step block *d*, and inclined or obliquely situated die plates D D, constructed as described, substantially in the manner and for the purposes specified.

No. 27,670.—JACOB F. HUNTER, of New York, N. Y., assignor to himself, H. A. HUNTER, and P. P. KELLER, of said New York.—*Improvement in Hot Water Apparatus.*—Patent dated March 27, 1860.—This invention consists in a novel arrangement of pipes with a water back, said pipes communicating with the radiators in the building from the top of the apparatus, and said radiators communicating with the water back by a return pipe.

Claim.—The combination of the coils F G, with the main pipe J, fire back A, return pipe J¹, and casing K, when the said coils are both connected with the main pipe J, and back A, and otherwise constructed as shown and described, for the purpose set forth.

No. 27,671.—CHARLES MILLER, of New York, N. Y., assignor to himself and GEORGE RICARDO, of said New York.—*Improvement in Machinery for Manufacturing Piled Fabrics.*—Patent dated March 27, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment, in the manufacture of piled fabrics, of a series of needles *a a* for passing the pile threads through a previously woven foundation in rows of loops, and of a single needle *N* operating transversely to the said series of needles, for the purpose of carrying a continuous filling or locking thread through the successive rows of loops of the pile threads, substantially as specified.

Second. The employment, in combination with the series of pile thread needles *a a*, and the filling or locking thread needle, of a tongue *u*, applied and operating substantially as described, to catch and prevent the withdrawal of the filling or locking thread.

Third. The attachment of the nippers 9, which draw the rods from the pile, to the same slider *Q*, or its equivalent, which carries the locking or filling thread needle *N*, so that the same mechanism serves to operate the said nippers and the needle, substantially as described.

Fourth. The combination of the nippers 11, and the stop 12, with the nippers 9, the whole operating together substantially as and for the purpose set forth.

Fifth. The combination with the two pairs of nippers 9 and 11, of the stop 12, the inclined plane 13, the recess 14, and the pusher 15, the whole operating together substantially as and for the purpose specified.

Sixth. Feeding the foundation *i* to the needles, and carrying away the finished piled fabric from the needles by means of a plate *K*, or its equivalent, pushing against the rods 7 7, substantially as described.

No. 27,672.—C. L. NELSON and OSCAR BOSTWICK, of Burlington, Vt., assignor to themselves and N. B. PROCTER, of said Burlington.—*Improvement in Wood Bending Machines.*—Patent dated March 27, 1860.—*S S* represents screws working in connection with the boxes of the shaft *A*¹, by means of which the wheel *A*¹ may be thrown out of gear with it, (*A*), and set at any distance from *A* in order to suit various sizes of timber. *B* is a wheel hung to guide *C* so as to press on the timber being fed. *B* is arranged to be raised and lowered by means of the set screws *d*. The guide *C* may be regulated by the screws *c c*.

Claim.—The adjustable guide, marked *C* in the drawing, and adjustable roller *B*.

No. 27,673.—ROBERT ROSS, of St. Albans, Vt., assignor to himself and GEORGE J. STANDARD, of said St. Albans.—*Improved Horizontal Water Wheel.*—Patent dated March 27, 1860. The object of this invention is to obtain a centre-vent water wheel, that may have its capacity readily varied according to the power required, and a uniform speed obtained with a varying power as occasion may require.

The inventor says: I *claim* the arrangement, in a centre-vent water wheel, of the plates *D E* fitted respectively into the scroll and to the wheel, as described, and connected to the frame *G*, to operate as and for the purpose set forth.

I also claim, in connection with the above, the projection *h* at the end of the plate *D*, when fitted in the socket *i* to leave a space *j*, between the projection and the back part of the socket, for the purpose specified.

No. 27,674.—H. D. WALCOTT, of Boston, Mass., assignor to H. WILLIAMS, of said Boston.—*Improvement in Eylet Machines.*—Patent dated March 27, 1860.—The two levers *A B* pivotted together at *a*, form a pair of pincers, the jaws *b c*, of which are widened out at their ends. The jaw *b* has attached to it at one corner the cylindrical plunger *e*, and at the other corner the setting punch or die *f*. To the inner face of the jaw *c* is pivotted, at 5, a piece *g*, which is free to oscillate towards either side of this jaw, except when confined by a thumb screw *h*, passing through a curved slot *i* in the jaw, and screwing into the piece *g*.

The inventor says: I *claim* the nippers *A B*, having their jaws *b c* provided with both a punch or cutter, and a closing or setting die, substantially as described.

Second. I claim the adjustable piece *g*, operating substantially as specified.

No. 27,675.—JOHN R. ALBERTSON, of East Deer Township, Pa.—*Improvement in Garden Hoes.*—Patent dated April 3, 1860.—The opening *A* of the blade is placed over the shoulder *C* of the shank *b*, the large opening *x* of the washer *e* is then placed over the dovetail, and then shoved down so as to secure the blade to the shank of the handle.

Claim.—Shank *b*, shoulder *c*, dovetail *d*, washer *e*, blade *a*, with the opening *A*; the whole being constructed and arranged as and for the purpose set forth.

No. 27,676.—EDWARD H. ANDERSON, of Easton, Md.—*Improvement in Vapor Burners.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the original arrangement of the apparatus set forth, and the new and useful adaptation of them to the purpose of producing a light which will be econom-

ical in cost, and which will be entirely exempt from the danger attending many other gas lamps.

I also claim the invention of a new and useful mode of procuring light by the combined action of atmospheric air and heat, by means of my original adaptation of the jet holes N N in the upper end of the conducting pipe A acting upon the under surface of the chamber D, the plow pipe principle of the jets producing the requisite heat to manufacture the gas as required for the support of the flame, and which combination enables me to raise the flame above the entire apparatus, thus rendering it clear of all obstructions; all constructed and operating as set forth.

No. 27,677.—EDWARD ARMSTRONG, of Pittsburgh, Pa.—*Improvement in Governor Valves of Steam Engines*.—Patent dated April 3, 1860.—This invention consists in dividing the valve chamber of governor valves of steam engines into two compartments, and in so arranging and balancing two valves, that an equal pressure of steam is made to act on each valve, thereby equally balancing them.

Claim.—Dividing the valve chamber of governor valves into two compartments, by means of the division plate *c*, provided with valves *j* and *i*, constructed, arranged, and operated in the manner described and for the purpose set forth.

No. 27,678.—A. MERRITT ASAY and J. LAMBERT ASAY, of Philadelphia, Pa.—*Improved Method of Fastening Artificial Teeth*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim fastening artificial teeth to a metallic plate by interposing between the said teeth and plate a strip of vulcanizable gum and vulcanizing or hardening the same, the teeth having been adjusted to the plate, as set forth.

We also claim packing with gum the interstices between the teeth and plate, or between the teeth themselves, when secured to the plate by rivetting or any other of the usual modes, and vulcanizing or hardening the packing after it has been adjusted, as specified.

No. 27,679.—GEORGE K. BABCOCK, of Utica, N. Y.—*Improvement in Measuring Faucets*.—Patent dated April 3, 1860.—This invention consists in applying a weighing device to a faucet in such a way that the substance to be drawn may be measured by weight, and the flow of the substance be cut off automatically by the gravity of the same when the proper or desired quantity has passed into the vessel prepared to receive it.

The inventor says: I claim connecting to the slide or valve of a faucet a scale beam or weighing device, arranged to operate as shown, or in any equivalent way, so that the substance to be drawn may be measured by its weight.

I further claim the combination of the scale beam I, pawl or catch H, arm F, lever D, and valve rod C, with its valve B, fitted within the tube A, all arranged for joint operation, substantially as and for the purpose set forth.

No. 27,680.—JOHN BAILEY and JOHN DE CAMP, of Cincinnati, Ohio.—*Improved Spring Bed Bottom*.—Patent dated April 3, 1860.—B are transverse pieces framed into the pieces A so as to form the frame of the bottom; D are conical coiled wire springs, their lower ends *d* being suitably bent for insertion into the pieces B, and their upper ends *d*¹ being bent so as to form a bearing for the slats C, and for insertion into the loops *b* of the straps E.

Claim.—The arrangement of the side rails A, transverse rails B, springs B *d d*¹, slats C, and straps E, the whole being constructed and combined in the manner and for the purposes set forth.

No. 27,681.—W. M. BAKER, of Walpole, Ind.—*Improved Refrigerator*.—Patent dated April 3, 1860.—This invention consists in the arrangement of a piece of canvas or other fibrous material over the corrugated or slatted inclined sides *b* of the case A, in combination with a perforated reservoir C on the top, and a receptacle D on the bottom, in such a manner that water or other fluid poured into the reservoir on the top is spread by the canvas over an extended surface where it is evaporated.

Claim.—The arrangement of a sheet B of canvas or other fibrous material in combination with the grooved and perforated or slotted sides *b* of the case A, and with the reservoir C, or its equivalent, constructed and operating substantially in the manner and for the purpose specified.

No. 27,682.—L. B. BATCHELLER, of Rochester, N. Y.—*Improvement in Machines for Manufacturing Barrel Heads*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim the combination and arrangement of the passive disk C, with the clamping disk C¹, hollow cam shaft G, and foot lever L, together with the cord J, for

actuating the saw table U, simultaneously with the clamping of the staves, and the pawl and lever P, operating conjointly, substantially as and for the purposes set forth.

I further claim the application of the lugs or hooks *k k*, to the clamping disk C¹, for the purpose of sustaining the staves while being supplied to the disks, substantially in the manner set forth.

No. 27,683.—H. N. BILL and J. C. BILL, of Willimantic, Conn.—*Improvement in Scales*.—Patent dated April 3, 1860.—This invention consists in the employment of a gravitating arm or lever arranged and supported on knife edges, and connected to the scale beam by a vertical rod, which is hung and supported to the short arm of the weighted lever and base of the scales.

The inventors say: We claim, first, the combination of the weighted lever D D¹, dependent rod E, vibrating rod F, perpendicular scale rod G, and swinging arms J, arranged and combined substantially as described and represented.

Second. We claim the slotted index hand L, hung on an isolated centre from the fulcrum of the weighted lever D, in the manner and for the purposes set forth.

No. 27,684.—BENJAMIN F. BOND, of Cambridge, Mass.—*Improved Construction of Clock Weights*.—Patent dated April 3, 1860.—The groove *c* is formed by placing the ball C in a lathe and turning out the groove, the bottom of the groove is turned smooth and true, so that the cord rests upon it, and, as the weight falls, it rolls over on the cord making its revolutions on an axis passing through the centre of the sphere at right angles to the groove *c*.

Claim.—The improved clock weight described, having a groove around its circumference for the reception of the cord, as set forth, for the purpose specified.

No. 27,685.—FRANCIS B. BOWMAN, of Waltham, Mass.—*Improvement in Scissors*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim making the clasp spring, with the separate pivots applied to it, and to enter the joint holes of the separate blades, as specified.

I also claim the arrangement of the clasp spring with respect to the blades and their handles, as specified.

No. 27,686.—EDWARD BROWN, of Waterbury, Conn.—*Improved Curtain Fixture*.—Patent dated April 3, 1860.—This invention consists in having a cord wound around the shaft of the shade roller, and having a circular disk attached to the roller shaft, the disk being used in connection with a clamp which is actuated, or adjusted, by the manipulation of the cord so as to admit of the shade being wound up or lowered and retained at any desired height.

Claim.—The disk wheel D, attached to the journal *a* of the shade roller A, in connection with the clamp, constructed substantially as shown, and connected with the cord E, which is wound on the journal *a* of the shade roller; all being arranged to operate as and for the purpose set forth.

No. 27,687.—JOHN BROWN, of New York, N. Y., and CHARLES R. ELLIS, of Brooklyn, N. Y.—*Improved Means of Regulating the Draft to the Fire in Warming Apparatus*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim regulating the amount of air draft admitted to the fire in hot water and other warming apparatus, by causing the overflow of water induced by ebullition to pass into a suitable vessel and regulate the draft passing through the fire, or the supply of cold air above the fire, or both, by the float and dampers, or any suitable device, as specified.

We also claim opening the draft to the fire after ebullition ceases by the withdrawal of the water from the overflow vessel into the warming apparatus through the syphon, or its equivalent, substantially as set forth.

No. 27,688.—WILLIAM G. BROWN and FREDERICK MCKEE, of Birmingham, Pa.—*Improvement in the Manufacture of Iron*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We claim, first, carrying the steam to the pipe G, in which it is to be superheated through a pipe L, smaller in bore than the bore of the pipe G, substantially in the manner and for the purpose set forth.

And we also claim so arranging the pipe G with regard to the furnace as that, while it is heated by the fire in the furnace, and shall jet its heated contents through or over the burning products therein, it shall be duly protected from the intensity of the said fire, substantially as set forth.

No. 27,689.—JESSE BURROUGHS, of Ridgeway, Pa.—*Improvement in the Purification of Coal and Ores*.—Patent dated April 3, 1860.—The claim explains the nature of this invention.

Claim.—Preparing coal for burning and ore for smelting by steaming it with a liquid composition of water, salt, nitre, potash, and lime, in the proportions substantially as set forth.

No. 27,690.—TYRANNUS P. BUTTERFIELD, of Indianapolis, Ind.—*Improved Device for Tilting the Bolt in Shingle Machines.*—Patent dated April 3, 1860.—The rest or vibrating table G is designed for the shingle blocks, and is operated by the spring H and guide or slide plate I, which rests on or is held up against the cross frame J by the spring H.

Claim.—The oblong plate J, in combination with the spring catch k, for the purpose of operating the table G, when used in connection with the knife frame, substantially as set forth.

No. 27,691.—PIETRO CINQUINI, of West Meriden, Conn.—*Improvement in Files.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Constructing a file with longitudinal grooves and a transverse cut, combining with said grooves to form teeth, substantially as described.

No. 27,692.—ELIZUR E. CLARK, of New Haven, Conn.—*Improvement in Apparatus for Building Concrete Walls.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combinations of the frames and sheeting boards with the braced uprights or inverted T's, when combined with each other and with the walls and floor timbers, in the manner described, and for the purpose stated.

Second. The cores shown in Figs. 4 to 21, inclusive, made as described, either whole or in separate parts, said cores being provided at suitable intervals either with core points to form recesses in the wall for the reception of the binders or with notches to fit upon the binders, and allow their lower edges to extend down between the said binders to meet that part of the wall which is already built, substantially as set forth.

Third. The combination of the rebated corner stays or guides O with the sheeting boards, as described, for the purpose stated.

Fourth. The combination with the frames A B and sheeting boards E of the lining plates d, of wood or metal, when placed inside of the sheeting boards to facilitate the raising of the frames, as stated.

Fifth. The combination of the cleats P P¹ P² and boarding Q Q¹ Q² with the frames which support the sheeting boards, for the purpose of forming string courses, water tables, and other continuous projections, as stated.

Sixth. The combination of the covering piece S and the fillet R with the perforation in the sheeting boards, for the purpose of forming window sills, caps, &c., as stated.

Seventh. So constructing the frames which hold the sheeting boards that the connection of the two sides shall be made entirely above the work, so that the concrete boxes may be raised by simply loosening the bolts which hold them together, and without any connection through the wall, as stated.

No. 27,693.—P. J. CLARK, of West Meriden, Conn., assignor to S. S. CLARK, of said West Meriden.—*Improvement in Cigar and Match Cases.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming a box or case by means of an outer shell furnished with guides, loops or slides, and two heads united by strips or ribs, the said strips or ribs passing through the guides, and the guides and heads limiting the extent to which the box may be opened and its contents raised up, to be easily taken hold of, as represented.

No. 27,694.—P. S. CLINGER, of Conestoga Centre, Pa.—*Improvement in Hand Cultivators.*—Patent dated April 3, 1860.—This invention consists in the arrangement of the hinged bar, cultivator teeth, roller, handle, and stop or check plate, in the manner and for the purposes desired.

Claim.—The arrangement of the hinged head piece or bar A, cultivating teeth B, roller C, handle D, and check plate E, substantially as and for the purposes set forth.

No. 27,695.—EZRA COLEMAN, of New York, N. Y.—*Improvement in Attaching the Grinding Surfaces of Quartz Mills.*—Patent dated April 3, 1860.—This invention consists in a ready and direct attachment of the grinding surfaces, and also in the means employed for regulating the positions of said grinding surfaces towards each other, by which means the same are trued.

The inventor says: In combination with the hollow shell A, provided at its end with suitable shaft bearings, the shaft G, and detachable grinding surfaces E and F, I *claim* the longitudinally acting screws l l l and the radially acting and concentrically adjusting screws f f and h h, the whole arranged, constructed, and operated substantially as and for the purpose set forth.

No. 27,696.—JOHN COOK, of Buffalo, N. Y.—*Improvement in Lathes*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Placing the tool N in a sliding box M, operated by the shaft O, screw rods g^1 g^1 , and bar f^1 , for the purpose of readily adjusting the turning tool with the stick and permitting the tool to be operated by the pattern, as described.

No. 27,697.—J. C. COOKE, of Middletown, Conn.—*Improvement in Welding Wrought Iron*. Patent dated April 3, 1860.—This invention consists in the employment of a suitable portable apparatus, which may be clamped at any convenient points to the sheets of metal undergoing the operation of welding, and may be rigidly held in place when required or moved along as the operation proceeds; which may be clamped to plates of various thickness or of any curvature; this apparatus consisting of one, two, or more suitable hammers or pressure rollers and a suitable heating media, for heating the surfaces to be welded to the welding point, at the same time excluding atmospheric air, so that the surfaces will not oxydize.

Claim.—The portable welding apparatus constructed and operating upon the principles described, wherein the heating and hammering or rolling operations are suitably combined and placed under the control of the operator, substantially as set forth.

No. 27,698.—JOHN P. COOPER, of Finleyville, Pa.—*Improvement in Machines for Overcoming the Dead Points of the Crank*.—Patent dated April 3, 1860.—This invention consists in the use of a double rack, slide, wheel, springs, and stops, arranged and combined for the purpose of overcoming the dead points of the crank.

The inventor says: I *claim*, first, the use of the shifting tooth d , springs e and i , and stops f and f^1 , when used in connection with the wheel c , rack b , and slide a , as described, and for the purpose set forth.

Second. The combination and arrangement of the wheel c , rack b , and slide a , as described, and for the purpose set forth.

No. 27,699.—WILLIAM COOPER, of Mount Gilead, Ohio.—*Improvement in Dirt Loading Apparatus for Excavators*.—Patent dated April 3, 1860.—A is a beam, to the forward end of which are secured a plough B and trough C; the plough is provided with two hand sides, one of which is secured to the beam and the other to the side of the trough C.

Claim.—The combination of the square shaft a with the sliding pulley C, band E, pulley x , and plough B, the several parts being arranged together substantially in the manner and for the purpose specified.

No. 27,700.—JOHN H. CRANE, of Charlestown, Mass.—*Improved Spring Bed*.—Patent dated April 3, 1860.—This invention consists in the peculiar form of the springs employed, together with their position and connection relating to the slats and rails of the frame with which the springs are connected, and in the peculiar form and arrangement of the rails.

Claim.—The combination and arrangement, substantially as specified, of the spring b , slats f , and adjustable frame a e .

No. 27,701.—DANIEL DESHON, 2d, of Somerset, Pa.—*Improved Churn*.—Patent dated April 3, 1860.—This invention consists in the mechanical arrangement for changing the fulcrum of the vessel which contains the milk, as the milk passes from one end of the vessel to the other.

Claim.—The combination and arrangement of the racks or breakers i , vessel a , pedestal or chair h , with the rockers b , with projections f , and notches g , in the rocker ways, the whole being combined, arranged, constructed, and operated in the manner described and for the purpose set forth.

No. 27,702.—J. V. DINSMORE, of Auburn, Me.—*Improvement in Metallic Heels for Boots and Shoes*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Securing heels to boots and shoes solidly, in all weather and climates and uses, by clamping the sole by the heel A, and drawing it thereon continuously by screw g , and the spring C, acting upon the plate B, or its equivalent, substantially in the manner and for the purposes fully set forth and described.

No. 27,703.—W. D. DORSEY, of Decatur, Ill.—*Improvement in Cultivators*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so combining the hinged beams C D of a cultivator with the treadles H I, as that the driver on his seat may raise either of the two central cultivator hoes F, separately, or all the hoes simultaneously, when constructed and arranged substantially in the manner and for the purposes described.

And I also claim, in combination with the pairs of hoes so hung and operated, the shields

L L, for protecting the young plants from the sods, earth, or soil turned up by the hoes, substantially as set forth.

No. 27,704.—FRANK DOUGLAS, of Norwich, Conn.—*Improvement in Steam Engines*.—Patent dated April 3, 1860.—This invention consists in the employment, in combination with a puppet valve within the same box attached to the cylinder and a spring for opening the valve, of a plate E.

Claim.—The plate E, in combination with the valve G, the spring F, and the bar A, the whole constructed to operate substantially as set forth.

No. 27,705.—NATHANIEL DRAKE, of Newton, N. J.—*Improvement in Corn Shellers*.—Patent dated April 3, 1860.—F is a spring, the lower end of which is secured in the case A in any proper manner. The upper end of this spring bears on the upper part of the plate, or bar E, and a set screw k, which passes through a nut l, attached to the case A, bears on the spring F, and regulates its pressure.

Claim.—The arrangement and combination of the oblique acting adjustable spring E, set screw k, plate E, and adjustable guard chain j, as and for the purposes shown and described.

No. 27,706.—ASAHEL K. EATON, of Kings County, N. Y.—*Improvement in Vulcanizing Caoutchouc*.—Patent dated April 3, 1860.—This invention consists in the use of saline solutions, the boiling points of which may be made to range by means of the greater or less concentration of the same through the different degrees of the temperature required for vulcanization, the solution being used in an open vessel.

Claim.—The new method of applying heat to India rubber or allied gums, when the same are ready for being vulcanized, by the employment of a saline bath, as set forth.

No. 27,707.—A. K. EATON, of New York, N. Y.—*Improvement in the Manufacture of Steel*.—Patent dated April 3, 1860.—The claim explains the nature of this invention.

Claim.—The conversion of cast iron in its solid form into steel, and the simultaneous purification of the same by treatment with the hydrates or carbonates of soda and potash, either alone or combined, substantially as described.

No. 27,708.—DANIEL P. FARNHAM, of Johnstown Centre, Wis.—*Improvement in Well Buckets*.—Patent dated April 3, 1860.—This invention consists in giving to well buckets a peculiar shape, in connection with a novel mode of hanging them.

Claim.—Hanging the buckets by chains D, when the bails are attached to the ends of the buckets below and in front of the succeeding chain, in combination with the holding pins h, and hooked arm c, as described and represented.

No. 27,709.—MOSES FRENCH, of Leesville, Ind.—*Improved Mill Stone Bush*.—Patent dated April 3, 1860.—The object of this invention is to obtain a bush for mill stones that will compensate automatically for the wear of the edges, and at the same time afford facility for the ready lubrication of the spindle.

Claim.—The employment, in combination with the box A and spindle B, of the adjustable plungers F, and oil channels i, substantially as and for the purpose set forth and described.

No. 27,710.—ROBERT GEORGE, of Mineral Point, Wis.—*Improvement in Metallurgic Operations applicable to Certain Ores of Zinc, Lead, Iron, Cobalt, and Nickel*.—Patent dated April 3, 1860.—The ores are continually supplied from the top B. When they are sufficiently roasted to decompose the steam, the valves of the steam pipe D are opened and the steam thus brought in contact with the whole body of the ores.

Claim.—The peculiar combination and arrangement of the several parts of the furnace, as described, with the application of steam for desulphurating sulphuret of zinc (blend black jack) and sulphurous ores, sulphates and sulphurets of iron, nickel, cobalt, copper, and lead, as described, and for the purpose, set forth.

No. 27,711.—HARVEY GUILD, of New Orleans, La.—*Improvement in Syphons Attached to Gas Retorts*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The annular syphon composed of an upright cup A, with a flaring or funnel-like mouth and central tube a, and a movable inverted cup D, provided with projections c c, by which it is enabled to be supported by the flaring or funnel-like mouth of the cup A, as described.

No. 27,712.—ALBERT GUMMER, of Indianapolis, Ind.—*Improvement in Automatic Grain Scales*.—Patent dated April 3, 1860.—This invention consists in using two boxes instead of

one, as in other machines, and in a provision for checking the sliding weight when passing from one side to the other without affecting its weighing quality; also a new method by which the number of bushels weighed are registered.

Claim.—The arrangement of the double box beam, with its vertical stem T T, for moving the horizontal slide valve, the two side rods L L and J J, with their sliding weights C C and D D, and the inclined planes M M and N, for checking the said weights, as described.

No. 27,713.—JAMES F. GYLES, of Gilmer Township, Ill.—*Improvement in Seeding Machines.*—Patent dated April 3, 1860.—This invention is an improvement on the seed sower of Aaron Ring, of Portland, Me., patented March 2, 1860.

The inventor says: I *claim*, first, the stud and angular slot or bayonet catch *b*, Fig. 1, when combined with the revolving arms of a rotary seed sower, in the manner set forth.

Second. The combination of the transverse partition *h*, Fig. 3, and the inclined partition *g*, Fig. 3, in manner and for the purpose specified.

No. 27,714.—JOHN C. HALL, of Fayette, Miss.—*Improvement in Buckles.*—Patent dated April 3, 1860.—The object of this invention is to obtain a buckle, or fastening, which may be attached without stitching, or sewing it to the ends of the band, belt, or strap which it is to connect, and to form not only a secure and permanent fastening, but also one that will readily admit of the band being taken up, or shortened as occasion may require.

Claim.—The combination of the ends of the belt, band or hoop *fg*, with a frame A, and bar B, in the manner and for the purpose substantially as shown and described.

No. 27,715.—JOSHUA HATHAWAY, of Marietta, Ga.—*Improved Device for Converting Reciprocating into Rotary Motion.*—Patent dated April 3, 1860.—This invention consists in arranging a reciprocating sliding rod in combination with two flanged wheels, and with independent pulleys and hinged tangential bars on the same shaft, in such a manner that by imparting a reciprocating motion to the sliding bar a continuous rotary motion of the flanged wheels is produced.

Claim.—The arrangement and combination of the reciprocating sliding rod G, rotary flanged wheels A A¹, shaft B, independent pulleys C C¹, and hinged bars D, constructed and operating substantially in the manner and for the purpose specified.

No. 27,716.—THEODORE AUGUSTUS HELWIG, of Minersville, Pa.—*Improvement in the Manufacture of Prussian Blue.*—Patent dated April 3, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* the application of mine water, containing sulphates of iron and free sulphuric acid, in the manufacture of Prussian blue, or any other native mineral water containing iron, and which will produce the intended effect.

No. 27,717.—JOSEPH C. HENDERSON, of Albany, N. Y.—*Improvement in Cooking Stoves.* Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the ash tube *t*, combined with the opening or openings 1 1, into the oven, as specified, whereby I am enabled to convey ashes from the box *s*, to the front hearth *f*, in stoves having a descending front draft entering the oven, in the manner and for the purposes set forth.

Second. I claim the air space formed between the plates *n* and *o*, combined with the air space 3, when the air passes in at the opening 2, for the purposes and as set forth.

Third. I claim admitting air to the fire from the space 3, by the opening 4, between the lower end of the plate *p*, and the grate *r*, as and for the purposes specified.

No. 27,718.—SAMUEL B. HOPKINS and EDWARD H. ANDERSON, of Easton, Md.—*Improvement in Vapor Burners.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The original arrangement and combination of parts, as above set forth, viz: the attachment of the burner B, the circular convex plate C, and the circular D, all as set forth, forming a distinct apparatus, capable of being attached to the ordinary slide A, of a single tube fluid lamp, by which a light equal to that given by four ordinary tubes combined is obtained, with one third the amount of oil, all operating and constructed as set forth.

No. 27,719.—JOHN E. KELLY, of New York, N. Y.—*Improvement in Riding Saddles.*—Patent dated April 3, 1860.—A is a ratchet wheel having an upright shaft *a* passing up through the pommel, or front part of the saddle, and terminating in the ring or handle *b*, which is used for turning the brake. The pawl to prevent the brake from giving way extends from the ratchet wheel through the upper lateral part of the saddle, terminating in a head or button.

To the shaft *a* is firmly secured a strong cord, or strap *E*, having on its loose end a snaffle hook.

Claim.—The application of a brake to a saddle, so constructed and arranged as to operate substantially as set forth and for the purposes and uses specified.

No. 27,720.—ADAM HUMBERGER, of Somerset, Ohio.—*Improvement in Corn Harvesters.*—Patent dated April 3, 1860.—This invention consists in an improved arrangement of the platform, or drop for shocking the corn, and in the arrangement of the knives, or cutters, spring guard and clamp for controlling the stalks, with a knife to prevent the choking of the machine.

The inventor says: I *claim*, first, the sectional platform *P*, arranged upon the frame, and pivotted as described, in combination with the rear end gate, for operation in the manner and for the purpose specified.

Second. The arrangement of the spring guards *D* and *H*, and knife *R*, in combination with the cutting apparatus, as constructed and applied, and operating together and in the manner and for the purpose specified.

No. 27,721.—CHARLES B. HOARD, of Watertown, N. Y.—*Improved Means of Winding the Springs of Clocks by Currents of Air.*—Patent dated April 3, 1860.—This invention consists in winding the spring of a clock, or other time piece, by connecting it with an air wheel or motor, so constructed and arranged as to be actuated by currents of air.

Claim.—Winding the spring of a clock, or other time piece, by connecting it with an air wheel or motor, so constructed and arranged as to be actuated by currents of air.

No. 27,722.—CHRISTIAN KRAMER, of Allegheny, Pa.—*Improved Sausage Stuffer.*—Patent dated April 3, 1860.—This invention consists in the use of two wheels working in combination with a screw, said screw and wheels being arranged and combined in a peculiar manner.

Claim.—The arrangement of the gatherer *n*, and feed piece *o*, in the hopper *b*, wheels *m*, and vertical screw *l*, arranged, constructed, and operated as described and for the purpose set forth.

No. 27,723.—JAMES LETORT and H. S. MATHEWS, of Wytheville, Va.—*Improvement in Breech Loading Fire Arms.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the compensating slotted sliding lever guard *g g h J K* with the jointed or hinged rammer *m*, the sliding lifting connecting rod *O P*, the slotted stock *b b b X X*, sliding, shifting, tilting, or jointed barrel *d d d y y y*, and breech loading gun or fire arm, substantially as set forth and described, or in any equivalent manner, whereby the several offices or functions are performed, as set forth, at one and the same time, through the operation or agency of the guard of a gun.

No. 27,724.—PETER LOW, of Cincinnati, Ohio.—*Improvement in Furnaces.*—Patent dated April 3, 1860.—This invention consists in an arrangement of pipes and flues, and the combination of parts in furnaces, stoves, &c.

The inventor says: I *claim*, first, in combination with the air heating chamber *Q* the fire pot *A*, flues *J*, gas chamber *I*, cylinder *K*¹, and smoke pipe *K*, the whole being constructed and arranged in relation to each other substantially as set forth.

Second. I claim the arrangement of the ventilating pipe *T*, gas chamber *I*, and smoke pipe *K*, said ventilating pipe *T*, which leads from the floor of the apartments to be ventilated, being made to pass through the inner space *Q* of the furnace, above the gas chamber *I*, and along side and in close proximity to the smoke pipe, and thence into the chimney, for the purpose of carrying off the vitiated air from the apartments, as specified.

No. 27,725.—GEORGE W. LANE, of Boston, Mass.—*Improved Apparatus for Testing Hollow Floats for Steam Boilers.*—Patent dated April 3, 1860.—The mode described by this inventor is too long for a place in this volume.

Claim.—The said float testing apparatus, to operate in manner and constructed substantially as described, and either with or without either or both the steam and water pipes *G* and *I*, furnished with stop cocks *M N*, as specified.

No. 27,726.—THOMAS LEWIS, of Malden, Mass.—*Improved Sugar Holder and Distributor.*—Patent dated April 3, 1860.—This invention consists in providing a close receptacle, with means for successive discharges of a given quantity of granulated or powdered material contained therein, at a convenient height from the base on which the receptacle for the discharged material rests.

Claim.—The combination of a receptacle *a* with a spring *k* and pocket *e*, when the latter is arranged substantially as and for the purpose specified.

No. 27,727.—C. B. MALLORY, of Fredonia, N. Y.—*Improvement in Straw Cutters.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement of the cylinder *N* and teeth *g*, when they are operated from the same crank in the following manner, to wit: the latter being operated directly from the crank *b*, and the former operated from said crank through the medium of the cross bar *f*, rack *M*, pinion *P*, ratchet *q*, and pawl *r*, substantially as described.

I further claim the suspending of the rack *M* to the shaft *l* of the cylinder *N* by means of the support *j*, and connecting the platform *O* to the cylinder, substantially as described, so as to admit of the rising and falling adjusting movement of the cylinder without interfering with the driving mechanism thereof.

No. 27,728.—SAMUEL W. MARSH, of Washington, D. C.—*Compound Lock and Label Sheath.*—Patent dated April 3, 1860.—This invention consists in constructing a compound lock and safety label sheath, for enclosing or holding a printed, written, stamped, or other kind of label, printed address or card, for the purpose of attaching the same securely to mail bags, trunks, &c.

Claim.—The construction of a compound lock and safety label sheath, or label case and label, as represented in the drawings, Figs. 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, and substantially as set forth and described.

No. 27,729.—WILLIAM D. MASON, of Jarrett's Depot, Va.—*Improvement in Machines for Sowing Fertilizers.*—Patent dated April 3, 1860.—*H* is the hopper through which runs a screw conveyor *S* turned by cogged connections *c*¹ *c*¹, so as to discharge from the end of the hopper into the furrow; a continual stream is thus kept up, and fed from the end of the hopper under the offset *O*. *F* is the frame supported by the driving wheels *W*.

Claim.—The arrangement of the screw *S*, hopper *H*, with its offset *O* and inclined plane *D*, gear wheels *c* *c*¹, driving wheels *W*, and frame *F*, as set forth, the discharge taking place under the offset of the hopper, as described.

No. 27,730.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Machines for making Rubber Belting.*—Patent dated April 3, 1860.—The nature of this invention is explained by the claim and engravings.

The inventor says: I *claim*, first, the new mode described of forming a series of machine belts or bands at one operation, the same consisting in rolling the India rubber or gutta percha into two or more sheets sufficiently wide to form two or more belts at a time, and upon the strips of fabric that compose the inner body of the belts, and then nipping the said sheets together and drawing them around the edges of the belts by the mechanical devices described, so as to completely encase the inner body of the belts, substantially as set forth.

Second. The peculiar shaped formers *h h*, operating as described, to unite the two sheets of India rubber or gutta percha, and also to form the edges of the belts, as described.

Third. The cutters *i i*, so arranged and operated as to run at different speeds and produce a shear cut upon the rubber or gutta percha, substantially as described.

No. 27,731.—EDWARD MAYNARD, of Brooklyn, N. Y.—*Improvement in Carriage Springs.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the double curved or wing shaped spring *c*, formed with separated leaves, as set forth, and connected at the centre part to the axle by means of the curved chair clip, or its equivalent, and by eyes at the ends to the bolts *l l* or body loops, substantially as and for the purpose specified.

I also claim the chair clip *d* to which the spring is firmly bolted, and which is attached to the axle by the two clip pieces *3 3*, whereby the axle is not injured by bolt holes for the springs and the weight is distributed on said axle, as specified.

No. 27,732.—OSCAR F. MORRILL, of Boston, Mass.—*Improvement in Vapor Burners.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improved arrangement of the tubular rotary cut-off and its elevating spring, with reference to the jet tube and the screw cap, such cut-off being provided or not, as circumstances may require, with a device for moving it both laterally and longitudinally, and such device being arranged at its lower part, substantially as described.

No. 27,733.—JOHN D. MURPHY, of Baltimore, Md.—*Improvement in Wheels for Flying Artillery Carriages.*—Patent dated April 3, 1860.—*A* is the tire or rim of the wheel made of wrought iron; *B B* are the spokes, also of wrought iron; *C* is the cast iron hub, which is cast

on the inner ends of the spokes, after they have been loosely fitted to the rim A; D is a loose iron flange having any suitable number of bolt holes *a a* and a round hole in which turns or works the part E of the hub C.

The inventor says: I *claim*, first, the combination of the solid hub C with the spokes B, substantially as set forth.

Second. I claim the combination and arrangement of the flange D, or its equivalent, with the hub C, substantially as set forth.

No. 27,734.—THOMAS M. MULLEN, of Philadelphia, Pa.—*Improvement in the Framing of Railroad Cars*.—Patent dated April 3, 1860.—This improvement consists in making the central longitudinal beam C of the frame of two separate strips *a a*¹, extending the whole length of the frame, with intervening packing pieces between the said strips, and in applying to the beam thus constructed the braces M M¹, at the points where it rests on the trucks, so that no piercing of the beam for the reception of the king bolts is required.

Claim.—The longitudinal beam C, composed of two strips *a* and *a*¹, with intervening packing pieces *b*, in combination with the diagonal braces M and M¹, the whole being constructed and arranged in respect to the king bolt substantially as and for the purpose set forth.

No. 27,735.—EDMUND MUNSON, of Utica, N. Y.—*Improvement in Grinding Mills*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the driver M, relatively, as shown, with the apex of the spindle F, to cause the apex of the spindle and the bearing surfaces of the arms *v v* of the driver to be in one and the same plane, and thereby admit of a universal adjusting movement of the runner C, to preserve the parallelism of the two stones, as set forth.

Second. The collar I, attached to the spindle F, perforated with holes *l*, in combination with the tube *k*, attached to and placed centrally within the box J, the perforations or holes *l* being above the bearings *h*, and below the top of the tube *k*, to operate as and for the purpose specified.

No. 27,736.—JULIUS POLLOCK, of Morrisiana, N. Y.—*Improvement in Ventilators for Hats*.—Patent dated April 3, 1860.—This invention consists in the combination, with a hollow inflated cushion A, of a series of small tubes or corrugations B, so located that when the hat is put on the head the said tubes will lie in the hollows formed by the depressions of the head at the temples.

Claim.—In combination with a hollow inflated cushion, the employment of tubes or corrugations for the passage of air, and so placed in the hat as to fit in the cavities of the head over the temples, as described, and for the purpose set forth.

No. 27,737.—RUEL RAWSON, of Quincy, Michigan.—*Improvement in Car Couplings*.—Patent dated April 3, 1860.—This is a self-connecting and disconnecting car coupling, with an attachment, whereby the coupling may be prevented from connecting, when it is desired to push any number of cars upon a switch by the action of the bumpers.

Claim.—The arrow headed bars B, springs *d*, standard S, and casing A, in combination with the guard bar G, arranged and operating substantially as set forth.

No. 27,738.—HARVEY RICE, of Concord, N. H.—*Improvement in Railroad Axle Boxes*.—Patent dated April 3, 1860.—This invention consists in combining with the box and axle a packing of leather, applied to the smallest part of the cone so as to be interposed between the conical surface and the groove which receives the usual packing, whereby the oil is prevented from reaching that part of the surface of the axle which lies between the cone and the usual packing.

Claim.—The combination of the inner packing applied to the axle at the smallest part of the conical surface, substantially as described, in combination with the axle having the said conical surface and the box with its outer packing, substantially as and for the purpose specified.

No. 27,739.—CORNELIUS J. ROONEY and DAVID RENSHAW, of New York, N. Y.—*Improved Pen Stand*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The pen stand or pen rest, as described, made by arranging the series of converging or conical and open bottomed cups 5 5, over the series of cups 6 6, one or both of these series of cups being so attached as to be readily removable to facilitate the cleaning of the lower cups, substantially as and for the purpose set forth.

No. 27,740.—ALONZO R. ROOT, of Canton, Mo.—*Improvement in Seeding Machines*.—Patent dated April 3, 1860.—This invention consists in combining the seed dropping valve

with a pivot flap valve and a double spiral spring, in order that the valve may be allowed to work whichever way the axle may turn and still be closed with a strong spring force; also in the arrangement of the revolving weed cutter or clearer in combination with the furrow openers and the moving frame of the planter.

The inventor says: I *claim*, first, the construction and arrangement of the inner cylindrical distributing device E, with the outer cylindrical case D G¹, flap valve L, axle A, and cut-off I, substantially as and for the purposes set forth.

Second. Combining the double spiral spring N, valve L, pivot k, and flap M, in the manner described and for the purpose set forth.

Third. Arranging the revolving weed cutter T in front of each plough, the shaft of which has its bearing in the front part of the plough, in such a manner that the cutter rod may also serve to lift the ploughs over obstructions, all as described and for the purposes set forth.

No. 27,741.—JAMES K. ROSS, of Lebanon, Ohio.—*Improvement in Fire Places*.—Patent dated April 3, 1860.—This improvement relates to an arrangement in connection with a customary open fire place of a system of passages, for the purpose of supplying apartments with properly warm and moistened fresh air.

Claim.—The arrangement, in the rear of an open fire place C, of a heated chamber F, vaporizing apparatus I J K, and registered communications G N L M M¹, with both the external and the internal air, as and for the purposes set forth.

No. 27,742.—SOLOMON N. SANFORD, of Cleveland, Ohio.—*Improvement in Apparatus for Starting City Railroad Cars*.—Patent dated April 3, 1860.—When the spring is wound up the car may yet run in either direction independently of said spring so long as the catches are kept clear of the ratchet wheels. The dogs T and U are released by pulling up the rods m n, which are held by the catch spring S. The spring V when under high tension slips over the catch R, without breaking.

The inventor says: I *claim*, first, the use of the spring V, when attached to notch R, in order to release itself under high tension, thus checking the running gear without breaking the spring, substantially as set forth.

Second. I claim the arrangement of the drum D, provided with the two independently revolving heads C and C¹, in combination with the spring V and axle X, all operating together with the dogs T and U, substantially as set forth, for the purposes specified.

Third. I claim the peculiar arrangement of the friction clutches E and F, arms G, ratchet bar H, pinion I, and shaft K, in combination with the drum D, spring V, and axle X, substantially as described, for the purpose set forth.

No. 27,743.—THOMAS SNOWDON, of Pittsburgh, Pa.—*Improved Feed Water Arrangement for Steam Boilers*.—Patent dated April 3, 1860.—By this invention the feed water in passing into the water space is exposed directly to the heat of the steam or water in the boiler before it discharges into the water space.

Claim.—Locating a feed water pipe within the steam space of the boiler, and having one end of said pipe communicate with the feed pump or doctor, and the other end dip down into the water space, as and for the purposes set forth.

No. 27,744.—JEREMIAH STEVER, of Bristol, Conn.—*Improvement in Portable Stamping Machines for Crushing Stones, &c.*—Patent dated April 3, 1860.—Power is transmitted to the ore crushing device by means of an endless band G², the connecting pulley H upon the shaft Z, and the pulley G upon the cam shaft D. As this shaft D revolves the cams a, which are arranged upon the shaft D, act upon the collars B fastened to the stampers C, and alternately lift and let fall the stampers for the purpose of crushing the ore contained in the box f, the perforations in the bottom f², and the open spaces between the bars f¹ forming the front of the box F, allow the pulverized substance to escape.

Claim.—The combination and arrangement of the carriages S P Q R, boiler T, oscillating engine U V W, pulleys H J G, gearing K L M N O, and stamping device E A B C F, in the manner and for the purposes set forth.

No. 27,745.—DAVID H. SMITH and E. E. SMITH, of Glenn Spring, S. C.—*Improvement in Ploughs*.—Patent dated April 3, 1860.—The mould board has two horizontal ridges i i on its rear side, which rest against the front surface of the foot B of the plough standard E. A horizontal brace J is fastened to the upper end of the standard E, through the agency of a shoulder Z, screw thread H, and nut H¹; both ends I I of the brace are screw threaded and inclined so as to pass at right angles through the handles L L, to which they are firmly secured by nuts I¹ I¹.

Claim.—The arrangement of the mould board A a, reversible cutter C, wedges i i, inclined and slotted foot B, standard E, with shoulder Z, and screw H, and the brace J, with inclined screw threaded ends I I, the whole substantially as and for the purposes set forth.

No. 27,746.—HENRY G. SMITH, of Muscatine, Iowa.—*Improved Metal Head for Brooms.*—Patent dated April 3, 1860.—This invention consists in the employment or use of cast-iron plates connected together by keys and lips and forming sockets, one to receive a handle and another to receive the broom or brush.

Claim.—Forming the broom and brush head of two parts A A, constructed as shown, and connected by the lips *b c* and keys *d*, substantially as and for the purpose set forth.

No. 27,747.—JOSEPH SMITH, of New York, N. Y.—*Improved Curtain Fixture.*—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the hooked pawl, with its grooved pulley H, spring J, and ratchet wheel P, arranged and operated with one cord so as to raise, lower, or stop the curtain at any desired point, as described and represented.

No. 27,748.—SAMUEL P. SWEENEY, of Columbia, Texas.—*Improvement in Cotton Seed Planters.*—Patent dated April 3, 1860.—The apparatus rests on a beam and is governed by the handles I. This construction admits of the hopper and other planting parts being removed, when the remainder can serve as a plough.

The inventor says: I *claim*, first, the adjustable, oscillating, planting apparatus A, constructed and operating as described.

Second. The combination of the stirrer *h* and agitator A, as described.

Third. The arrangement of coverer D, driving wheel W, hopper H, cutters C C, stock P, and opener O, as and for the purposes set forth.

No. 27,749.—ALBERT W. TANNER and ORLANDO P. GORTON, of Paw Paw, Mich.—*Improved Window Curtain Fixture.*—Patent dated April 3, 1860.—This invention consists in an arrangement so that the curtain can be either raised from the bottom or lowered from the top of the window, or, if desired, placed at any inclination.

The inventors say: We *claim*, first, the employment of the wheel *d*, when the same shall be constructed and used, substantially as and for the purpose specified.

Second. We claim the spools *a a*, pulleys *b b*, and cords *m* and *n*, in combination with a wheel *d*, the whole being constructed and arranged substantially as and for the purpose set forth.

No. 27,750.—THOMAS RANDOLPH TAYLOR, of Cleveland, Ohio.—*Improved Horse Shoe Machine.*—Patent dated April 3, 1860.—This invention consist in a novel system of dies, and the means of operating the same to forge a shoe with front and back calks by a continuous operation.

The inventor says: I *claim*, first, the combination of a reciprocating male die N, a reciprocating female die O, and a pair of recessed, reciprocating, and swinging jaws R R, the whole arranged and operating in relation to each other, substantially as described.

Second. The combination of the projections 10 10 on the male die, and the recesses 11 11 on the female die, operating together, substantially as described, to produce the heel calks on the shoe.

Third. The combination of the recesses *r r* in the swinging jaws R R, and the recess *f*, in the female die O, said recesses operating in conjunction with the other parts of the jaws and female die, as described, to produce the toe calk.

Fourth. Effecting the closing of the swinging jaws R R by their descent into an opening *v v* in the bed plate of the machine, substantially as described.

Fifth. The attachment of the movable cutter U to a slide U¹, arranged and operated by the mandrel of the male die N, substantially as specified.

No. 27,751.—A. L. O. WALL, GEORGE ROBERTS, and MILO S. CARTER, of Decatur, Ill.—*Improvement in Mole Ploughs.*—Patent dated April 3, 1860.—As the coulter advances through the soil it draws the mole after it, and leaves a slit behind it extending from the bottom of the drain to the surface. The mole crowds the loose earth away from its path, and compacts it against the sides of the perforation, which it makes during its progress.

Claim.—The ovoid-shaped mole, in combination with the scooping flanges, substantially as described, for the purposes set forth.

No. 27,752.—PETER L. WEIMER, of Lebanon, Pa.—*Improvement in Governor Valves for Steam Engines.*—Patent dated April 3, 1860.—This invention consists in a self-adjustable cut-off for a steam engine, the point of the cut off being determined by the governor, and varied as there is labor put on or thrown off the engine, thereby giving the engine a regular motion.

Claim.—The combination and arrangement of a self-adjustable cut-off valve by means of the shaft S and arm T latching into the latches H, and adjusted by the governor attached to the arm W operating the shaft, by means of an eccentric X working in the frame R, in such

manner that when the engine slightly changes its speed, the shaft, with its arms T, will be moved from or towards the latches H, substantially as described.

No. 27,753.—J. W. WETMORE, of Erie, Pa.—*Improved Legislative Voting Register*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging the names of the voters in a series of blocks or types, each of which moves independently of the others, and is under the exclusive control of the voting member himself, for the purpose set forth.

Second. The combination of the printing mechanism with the balloting mechanism, when the two are arranged in such manner as to be operated simultaneously by the same mechanism, for the purpose set forth.

Third. Constructing the ballot boxes of such capacity as to contain but one ballot ball at a time, when the same are provided with doors, escape of slides or valves at top and bottom to prevent the entrance or escape of more than one ball at each vote.

Fourth. Constructing the ballot boxes with an entrance door, slide, or valve, under the control of the speaker or other proper officer, and an exit door, slide, or valve, operated by and under the exclusive control of each voter, for the purpose described.

Fifth. An automatic counting or registering apparatus, operated by clock work, or its equivalent, to indicate optically the number of votes cast.

Sixth. The combination of the balloting mechanism with the counting or registering mechanism, when arranged in such manner that the latter is operated by the passage of the ballot balls from their boxes into some suitable receptacle, for the purpose described.

Seventh. The combination of a printing mechanism, a balloting mechanism, and a counting or registering mechanism, when the same are arranged for joint operation, in such manner that each one serves as a check whereby to ascertain the accuracy of the operation of the others.

No. 27,754.—WILSON W. WILLIAMS, of Elizabeth City, N. C.—*Improvement in Sowing Machines*.—Patent dated April 3, 1860.—This machine consists of two hoppers H leading down into the box A, having a partition P longitudinally to keep separate the grain and the manure, and perforated at the bottom with holes of any size or number required. C is a frame fastened to the shafts, in which frame the hoppers rest. The box A is suspended from the frame C by the leather straps R.

Claim.—The arrangement of hoppers H, box A, partition P, frame C, straps R, and wheel W, placed on an ordinary or common cart, operating as described, and for the purposes set forth.

No. 27,755.—LEANDER W. BOYNTON, of New York, N. Y., assignor to himself and DURHAM & BOOTH, of New Haven, Conn.—*Improvement in Attaching Thills to Vehicles*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of the hook and eye, in combination with the flanged plate and rubber, when the pressure of the rubber against the eye is regulated by means of the flanged plate, with its screw bolt, and the whole is constructed and made to operate substantially as described.

No. 27,756.—CHARLES DIEDRICH and WILLIAM T. SLOCUM, of Philadelphia, Pa., assignors to JAMES T. MASON & Co., of said Philadelphia.—*Improved Machine for Making Metal Caps for Boxes*.—Patent dated April 3, 1860.—This invention consists of a shoot or conductor S, with a bent tongue, inclined side, and verticle chamber with an opening, arranged in respect to the die of the cutting punch, and the die for turning the edge of the disk, so that the disks after leaving the cutting die may assume a proper position for the action of the forming die; also in a device for forcing the lids or bottom from the openings in which they have been formed.

The inventors say: We *claim*, first, the shoot or conductor S, with its bent tongue Z, its inclined side, verticle chamber, and opening *x*, the whole being constructed substantially as set forth, and arranged in respect to the die *f* of the punch *e*, and the die *q* of the rod Q, as specified.

Second. I claim the rod Q and its die *q*, with the central opening for the rod *t*, the whole being arranged in respect to the vertical chamber, the shoot S, and its opening *x*, and operating as and for the purpose set forth.

No. 27,757.—GEORGE FELTER, of Philadelphia, Pa., assignor to himself, EDWARD JONES, and JACKSON P. COWLEY, of said Philadelphia.—*Improvement in Cutting Apparatus for Harvesters*.—Patent dated April 3, 1860.—This invention consists in so arranging the knives or separate inclined planes formed on the cutter bar, that they will underlap and overlap each other; also, in the reciprocating driving rods with projections, or their equivalents, so combined with, and arranged in respect to, the forked ends of the shanks of the vibrating knives,

that the said knives shall be moved alternately from a point above and a point below their cutting plane, thus causing the cutting edges to be invariably in close contact with each other.

The inventor says: I *claim*, first, arranging the vibrating knives upon separate inclined planes, so formed on the cutter bar, that the said knives may underlap and overlap each other in the manner specified.

Second. I claim the driving bars C and D with their respective projections, or equivalents thereto, in combination with the inclined knives and their forked shanks, the whole being arranged and operated substantially in the manner and for the purposes set forth.

No. 27,758.—FRANK G. JOHNSON, of Bellwood, Sag Harbor, N. Y., assignor to himself and DANIEL F. TOMPKINS, of Newark, N. J.—*Improved Wind Machine for Pumping Water*.—Patent dated April 3, 1860.—The pressure of the wind will force back the frame A, carrying with it the rod K, and by means of the connecting rod c, elevating the weight g, or its equivalent—the handle on the piston rod of the pump—until K reaches the position shown at A², when the angular projection on the disk h is caught by the wind, and the upper part of A will then overbalance the lower part, and A will turn on its bearing at L.

Claim.—The wind surface A h, in combination with the vane b, connecting arm k f, rod c, and weight g, the whole constructed and operated in the manner and for the purposes set forth.

No. 27,759.—ALEXANDER McELROY and ROBERT B. McELROY, of Waupun, Wisconsin, assignors to Robert B. McELROY, aforesaid.—*Improvement in Seeding Machines*.—Patent dated April 3, 1860.—The series of cams formed by the zig-zag shape given to the flanch A, as they revolve with the wheel J, impart motion to the lever B, which is reciprocated by the reacting spring C, moving the lever through the rod P, and thus vibrating the slide E and agitator V, connected to the longer arm of the lever B, said lever having its fulcrum on the frame work of the machine at the point a¹.

Claim.—The arrangement of the deflecting boards G¹ and H, the rod N, and the seed hopper, provided at its bottom with the vibrating agitator V and seed slide E, in which are cavities o and openings e, the whole being used substantially as and for the purpose specified for scattering the seed broadcast.

No. 27,760.—JOHN McMURTRY, of Fayette County, Ky., assignor to G. B. KINKHEAD, of Lexington, Ky.—*Improvement in Operating Hoisting Wheels*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Removing the pinion g entirely out of gear with the spur wheel f on the roller shaft, so as to permit the spur wheel f to turn freely, and, at the same time, at will, either to let the pinion g rest between the gearing of the fast or slow motion, or cause it to pass immediately in gear with the fast, or return it to the slow motion, substantially as described and for the purposes set forth.

No. 27,761.—THOMAS NEWLOVE, of Chicago, Ill., assignor to himself, JAMES BOWLEY, and T. LYNCH, JR., of said Chicago.—*Improvement in Sewing Machines*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the sheathed guide lever l, with the straight looper n¹, substantially in the manner described, and for the purpose of securing a positive forward and back, as well as a positive lateral, movement to the looper.

No. 27,762.—JOHN STEVENS, of New York, N. Y., assignor to H. BRIND, of said New York.—*Improvement in Mechanism for Threading Sewing Machine Needles*.—Patent dated April 3, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination and arrangement of the perforated piece 3, provided with a set screw or other convenient means of attaching it to the needle with the arm 6, jointed to the piece 3, as described and shown, in such a manner as to furnish a ready and convenient means of securing the accurate adjustment longitudinally with the needle, to cause the hook 7 to enter the eye of the needle as set forth.

Second. The combination with the arm 6, containing the hook 7 of the flanges 8 8, to secure the proper lateral adjustment of the hook, substantially as set forth.

Third. The combination, with the folding arm 6, and with the needle beam, of the spring 9, substantially as and for the purpose set forth.

No. 27,763.—WILLIAM THOMAS, of New York, N. Y., assignor to himself and WILLIAM WEBB, of said New York.—*Improvement in Machines for Moulding Candles*.—Patent dated April 3, 1860.—This invention consists in the application of a pouring dish to the top of the mould frame, so operating in connection with the wick holders that the tallow is prevented from coming into contact with the mould bed; also in the use of a supporting frame for

sustaining the candles by their wick holders while taken off the moulding frame after having been discharged from the moulds.

The inventor says: I *claim*, first, the pouring pan, fitted with holes so formed as to enclose, in combination with the wick holders, the top of each mould, as described.

Second. I claim the arrangement of the wick holders upon slides, so as to be capable of shifting the wicks to one side of the moulds for facilitating the free entrance of the tallow, as described.

Third. I claim the supporting frame, operating in combination with the discharging apparatus and with the wick holders, for raising and supporting the candles after they are discharged, as described.

No. 27,764.—GEORGE W. N. YOST, of Yellow Springs, Ohio, assignor to G. W. N. YOST & Co., of said Yellow Springs.—*Improvement in Corn Planters*.—Patent dated April 3, 1860.—The operation is as follows: The extremities of the arms C in the two series are set, and then the machine is drawn forward across the field, thus planting the hills at uniform distances.

Claim.—The arrangement of the cams G, slides F, and crank pin H, in connection with the radial arms C, in the manner and for the purposes substantially as described.

No. 27,765.—JAMES ALDRICH, of Washington, D. C.—*Improvement in Water Elevators*.—Patent dated April 10, 1860.—The girder *i* extends horizontally under the windlass, to which is secured the guide *h*, forming the socket *s*, and has a projection against which the bolt *f* locks. As the bucket *n* is drawn up, the bail *m* comes in contact with the rods *l l*, extending across parallel with the girder *i*, which turns it in position, and being guided by pieces *r r* is sure to place one edge of the bucket under the hook *p*, and then being raised sufficiently, will empty its contents into the spout in the recess *d*.

Claim.—The mechanical arrangement of the pulleys $e^1 e^2$, the sliding bolt *f*, and spring *t*, the rope *g*, the guide *h*, and sockets *s*, the rods *l l*, and guides *r r*, or their equivalents, for the purposes set forth.

No. 27,766.—C. ATKINSON, of Vermont, Ill.—*Improvement in Seeding Ploughs*.—Patent dated April 10, 1860.—The object of this invention is to obtain an implement for planting seed, and, at the same time, for preparing the ground in a more proper state than usual to receive the seed and favor its rapid germination and growth. It consists in an arrangement of rotary cutters, double mould board share, subsoil share, and seed distributing device.

The inventor says: I *claim*, first, the arrangement of the double mould board share F, coulter G, subsoil share e^* , and a suitable seed distributing device, for joint operation as set forth.

Second. The supporting of the implement by the wheels B B I l l, when arranged with the beam D, axle A, and bar E, substantially as shown, to graduate the depth of the cut of the shares as specified.

No. 27,767.—LUTHER ATWOOD, of New York, N. Y.—*Improvement in the Distillation of Hydro-Carbon Oils*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The use of steam in preparing a hot still for the safe admission of a charge of oil, substantially as described.

No. 27,768.—LUTHER ATWOOD, of New York, N. Y.—*Improvement in Apparatus for the Distillation of Coal Oils*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a volatile oil still, capable of being heated at the sides, and constructed with a removable lower section consisting of the bottom and a short section of the side, substantially as described, and substantially for the purposes set forth.

Second. The combination of a weighted safety valve with a volatile oil still, constructed substantially as described, and so arranged as to relieve the still from pressure when the condenser becomes choked.

Third. The steam pipe and valve O, safety valve N, and closed angle valve L^1 , when used in combination with a still and steam boiler, the whole substantially as described.

Fourth. The steam pipe and valve P, and angle valve L^1 , when used in combination with the condenser and steam boiler, substantially as described, and substantially for the purposes set forth.

Fifth. The use, in combination, of two or more man holes in the top or cover of the still, substantially as described, and substantially for the purposes set forth.

Sixth. The use of the main N^4 , in combination with the safety valve, substantially as described, and substantially for the purposes set forth.

Seventh. The described mode, substantially, of setting a still so that the lower section can be removed without disturbing the main body of the still.

No. 27,769.—JOHN AVERY, JR., of New York, N. Y.—*Improved Steam Trap Valve*.—Patent dated April 10, 1860.—When the pipes and cylinder are cold, the contraction of the pipe F causes its free end to leave the valve c, and thus an opening is formed and the water runs out of it into the chamber L, and thence out of the waste pipe K. When steam is let into the pipe F or it becomes heated, it expands until it closes its free end against the valve c and thus remains tight so long as the heat remains in it; and its elongation beyond a certain point is taken up by the compression of the spring or cushion under said valve and prevents any breakage.

Claim.—The combination of an expansible tube, an elastic or self-yielding adjustable valve and a condensing chamber, substantially in the manner and for the purpose set forth.

No. 27,770.—JOHN M. BATCHELDER, of Cambridge, Mass.—*Improvement in Compounds for Insulating Telegraph Wires*.—Patent dated April 10, 1860.—The claim explains the nature of this invention.

Claim.—A telegraph wire, or other conductor of electricity, insulated with a compound substance, composed of pulverized silex, glass, or other non-conducting material, mixed with India rubber and sulphur and subsequently vulcanized, substantially as described.

No. 27,771.—LORENZO BEACH, of Montrose, Pa.—*Improvement in Horse Rakes*.—Patent dated April 10, 1860.

The inventor says: The coupling together of the teeth arms by wooden pins obviates the necessity of using iron rods, which are liable to rust, and make it difficult to take the teeth arms out for repair. By removing the cap b from the block a, either pair of the teeth arms can be taken out for repair.

Claim.—The arrangement of the teeth arms c, the pivot pins w, blocks a, semi-circular rests t, lever s d, handles h, and balance k, as described and for the purposes specified.

No. 27,772.—GEORGE W. BIGELOW, of New Haven, Conn.—*Improved Burglar's Alarm*.—Patent dated April 10, 1860.—This invention consists in arranging two pivoted jaws in combination with a spring in such relation to each other that the tapering end of one of the jaws can be depressed into a slot in the end of the other jaw, and that both together, when thus compressed, can be inserted into the crack of a door or window up to a shoulder which projects from one of said jaws, so that when the door is opened one of the jaws strikes against a nipple attached to the other one and explodes the cap.

Claim.—The arrangement of the pivoted jaws A B with the tapering ends f g, and with the hammer c and nipple d, in combination with the spring C, constructed and operating substantially as and for the purpose described.

No. 27,773.—SEWALL BRACKETT, of Fall River, Mass.—*Improved Knife and Fork Cleaner*.—Patent dated April 10, 1860.—This invention consists in a combination of fibrous, revolving, scouring rollers B, driven by the cog gear D, and set in motion by the crank H.

Claim.—The combination and arrangement of the scouring rollers B and C, the gears D, the saddle F, the rods I, the springs d, cases A and E, all substantially as and for the purposes specified.

No. 27,774.—F. CHAMBERLIN, of Berlin, Wis.—*Improvement in Seeding Machines*.—Patent dated April 10, 1860.—This invention consists in constructing and arranging the several parts of the machine.

The inventor says: I claim, first, the arrangement of the dragging seed troughs P P P, hinged and held in position by means of springs S S S, when the same are used in connection with the seed spouts a a a and seeding cylinder C, substantially as and for the purpose specified.

Second. The combination of the seeding cylinder C, provided with cups, as set forth, with the hopper A¹ and A and box D, provided with seed spouts and with a hinged cover F, for drilling or seeding broadcast, substantially as specified.

No. 27,775.—SAMUEL CHAMBERLAINE, of Philadelphia, Pa.—*Improvement in Apparatus for Generating Gases*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I claim, first, combining the two vessels A and B, which contain the gas making ingredients, by means of a syphon C, substantially as described, so that when a reduction of pressure is produced in the generating vessel by permitting the escape of gas or air therefrom, the acid or other liquid from the other vessel will be caused to flow over into the generating vessel by the difference of pressure.

Second. The arrangement, in combination with the two vessels A and B and their connecting syphon C, of the two three-way cocks, or their equivalents, E and G, in the outlets of such vessels, the connecting pipe h between the said cocks, or equivalents, and the piston H,

geared with said cocks, or equivalents, whereby, when the pressure in the generating vessel reaches a certain degree, the gas is caused to flow back to the other vessel, and so prevent more acid or other liquid coming over from the latter vessel, and when a further increase of pressure takes place, providing for the escape of gas to the atmosphere, substantially as described.

Third. The pumping apparatus, consisting of the cylinder M, with its partition i, two connected pistons K K¹, passages and double four-way cock L, applied substantially as described, in combination with the generating apparatus and the receiver or cooler O, to deliver gas and water simultaneously into the receiver and cooler at a uniform pressure.

No. 27,776.—JOHN G. CHRISTOPHER, of Byron, Ill.—*Improvement in Cultivators*.—Patent dated April 10, 1860.—The object of this invention is to obtain a cultivator that may be rendered capable of performing various kinds of work, as may be required, by a very simple adjustment of parts.

Claim.—In combination with the ploughs C C D, the adjustable bar p, provided with the roller t, and arranged to permit of the adjustment, as shown, for the purpose set forth.

No. 27,777.—JOHN COCKBURN, of New York, N. Y.—*Improved Pen and Pencil Case*.—Patent dated April 10, 1860.—This invention consists in combining with an ordinary spirally slotted tube, for operating the pencil tube, an extension tube and pen slide, all arranged relatively to each other and fitted within a shell or external case to effect the desired end.

Claim.—The combination of the spirally slotted tube D, extension tube B, the longitudinally slotted tubes b c, and the tube E, with the pencil slide F and pen slide G; the pencil slide F, pen slide G, and the tube D being provided respectively with pins m i l, which fit in the slots g c d of the tubes D C, and all arranged relatively with each other and the case A, as and for the purpose specified.

No. 27,778.—CALVIN COX, of Coxville, N. Y.—*Improvement in Breech Loading Fire Arms*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Dividing the barrel transversely at such a point that part of the bore, which receives the charge, shall be a fixture with the breech, in combination with the manner of hinging the barrel, and producing a close lock joint between the same and breech, substantially as and for the purposes set forth.

No. 27,779.—PEARSON CROSBY, of New York, N. Y.—*Improvement in Saws*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making saws with the teeth of the form substantially as described, that is to say, with the two angles on the upper edge and with the sides of the teeth, after being set, brought to a plane on each side, parallel with the face of the saw, substantially as described; but this I only claim in combination with the slitting teeth made of greater length than the cutting away teeth, and bevelled laterally and alternately on opposite sides, substantially as and for the purpose specified.

No. 27,780.—A. CUTLER and E. S. WRIGHT, of New York, N. Y.—*Improved Carpet Beater and Cleaner*.—Patent dated April 10, 1860.—The whips a¹ consist of curved elastic arms with rounded ends, or with a piece of wood b¹ secured to their ends. These arms are all secured to the shaft E, and are bent in the form of parabolic curves. The rotary beaters create a current of air in the box D, which assists in dispelling the dust and discharging it from the box.

The inventors say: We claim, first, the employment of the parabolic spring beaters a¹, when the same are elastic throughout their entire lengths, and are arranged upon a driving shaft E, substantially as shown and described, for the purpose set forth.

Second. The arrangement and combination of the blast spouts M N and beaters a¹, as shown and described.

Third. The arrangement and combination of the rollers B, endless bands a, boxes D D¹, beaters a¹, spouts M N, suction pipe J, fan boxes G G¹, fans H H¹, and discharge spout K, as and for the purpose shown and described.

No. 27,781.—ELLIOT DICKERMAN, of Richmond, Vt.—*Improved Clothes Wringer*.—Patent dated April 10, 1860.—This is an invention for using India rubber rollers for pressing water from clothes after washing, so that the rollers will have the elasticity due to the entire roller during the pressing operation.

Claim.—The arrangement of rubber rollers R R¹, rigid rollers B B¹, and their respective shafts, with the slotted frame F, as described, whereby the entire elasticity of the rubber rollers is rendered available for the desired purpose.

No. 27,782.—LOVETT EAMES, of Kalamazoo, Mich.—*Improved Mortising Tool*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In combination with the parallel lip *d*, on the side of the auger cap, the hollow conical mouthed and scalloped chisel point, whereby a hole the full width of the chisel may be bored by the auger, and the cuttings made by the auger will be directed towards the centre of the auger, as described.

No. 27,783.—SETH W. EELLS, of Mansfield, Ohio.—*Improvement in Apparatus for Evaporating Sugar Juices*.—Patent dated April 10, 1860.—This invention consists in having an evaporating pan for boiling and graining thick syrup; in having a boiler constructed with one or more tubes passing through it, to expose more surface of heat to the syrup, and the same boiler also to have one or more partitions to separate somewhat and the better to manage the different stages of boiling syrup from the fresher cane juice; and also so constructing the apparatus that the steam from the boiling tank may be conducted in tubes through pipes of fresh juice, to raise the scum for purposes of defecation.

The inventor says: I *claim* the evaporating pan for boiling thick syrup and graining sugar, such pan being placed in another pan or vat containing fluid, substantially as described, that the danger of burning or overheating the graining sugar may be obviated.

I also claim the application of the principle of using tubes in the boiler, substantially as described, to increase the heating surface for evaporating cane juice, thereby expediting the process and economizing space.

I also claim the application of this principle to the purpose of evaporating cane juice or sugar, substantially as described.

No. 27,784.—JAMES E. EMERSON, of San Francisco, Cal.—*Improvement in Fastenings for Axe Handles*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of the lips *a a*, in combination with the axe *A*, head *e*, key *c*, and wedge *d*, when the said lips constitute a part of the axe and are made flush therewith, all as shown and described.

No. 27,785.—JAMES E. EMERSON, of San Francisco, Cal.—*Improvement in Lubricating Carriage Axles*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Supplying the oil to the axle through the bottom of a tube *A*, or that end nearest the axle, by means of a screw cap, valve stem and valve, arranged and operating essentially as set forth and for the purposes described.

No. 27,786.—ORMROD C. EVANS, of New York, N. Y.—*Improvement in Steam Engines*.—Patent dated April 10, 1860.—This invention consists in converting reciprocating into rotary motion, and applying the same to stationary steam engines by a cam operated by a jointed piston rod, which rod presses the cam upon the outer face of the driving wheel *G* in its backward motion, while the cam *B* is detached from the face of the wheel *G* during the forward movement of the piston and cam.

Claim.—The cam *B*, the rule joints *A A¹ A² A³*, bridles *F F*, arms *e e*, springs *s s*, and compound lever *c*, in combination, constructed and arranged substantially as described, and for the purpose set forth and shown in the drawings.

No. 27,787.—JOHN N. FARNAM, of Hartford, Conn.—*Improved Knife Sharpener and Cleaner*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the polishing plates *B C*, to be used in the manner and for the purpose described, substantially as set forth.

Second. The arrangement of attaching the knife sharpening plates *G G¹* to the plate *C*, to be used for the purpose described, substantially as set forth.

Third. I claim the gate *E*, constructed and combined with the hoppers *D D¹*, as and for the purpose specified.

Fourth. I claim the combination of the polishing plates *B C*, the hoppers *D D¹*, with the sharpening plates *G G¹*, and spiral springs *b b¹*, constructed and arranged as and for the purpose specified.

No. 27,788.—GEORGE H. FAYMAN, of Washington, D. C.—*Improvement in Butt Hinges*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A loose butt hinge, with a changeable axis to adapt it to being used on the right or left hand.

No. 27,789.—WILLIAM FINLAY, of Schoolcraft, Mich.—*Improvement in Seeding Harrows*.—Patent dated April 10, 1860.—The object of this invention is to throw the seed hopper out of gear with the traction wheel by a simple movement of the lever by the driver, and also the raising or depressing of the forward end of the machine, which is also controlled by the driver from his seat.

Claim.—The wheel H, arms N, bars K K, and connecting rod M, with the lever M¹, in combination with the seed hopper G, when the same are arranged and combined with the front adjustment of the revolving harrow frame, set forth, for the purposes specified.

No. 27,790.—R. H. FISHER, of Beverly, N. J.—*Improvement in Securing Handles for Cutlery*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The described method of attaching handles to cutlery and other implements, to wit: having a flat tang B, with a barb *a*, fitted within a hole *b*, the mouth of which is sealed by the bolster *c*, and then introducing melted metal within the handle through the hole *d*, so as to surround and hold the tang, all as set forth.

No. 27,791.—GEORGE P. FOSTER, of Providence, R. I.—*Improvement in Cartridge Cases*.—Patent dated April 10, 1860.—This invention consists in making the cartridge case with a recess or grease chamber within its projecting head, which serves to close the joint of the breech of the gun.

Claim.—The improved cartridge case, as made with the grease chamber arranged within it and in its head, as specified.

No. 27,792.—THOMAS FRY, of Brooklyn, N. Y.—*Improved Chair Castor*.—Patent dated April 10, 1860.—This invention consists in affixing to the central stock *c* a permanent cap or base F around which the wheel or castor will revolve; also affixing a spring B made of India rubber or metal around the central stock *c*, to operate with the castor D with sufficient power to overcome the weight of the chair.

Claim.—The combination and arrangement of the stock *c*, the base F, the spring B, with the wheel D D, substantially as and for the purpose specified.

No. 27,793.—ADONIRAM J. FULLAM, of Springfield, Vt.—*Improvement in Punches*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—An improved punch, as made with its side faces curved relatively to the stamping or end face of it, substantially as described.

No. 27,794.—ROLLIN GERMAIN, of Buffalo, N. Y.—*Improved Paddle Wheel*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction of a paddle wheel for vessels for navigation, wherein the paddles are made and hung, substantially as set forth, in combination with a spring or springs placed upon the wheels, and so connecting with and acting upon the paddles as to hold them edgewise in the line of motion while passing through the atmosphere, and cause them to enter the water edgewise and allow them to glance or turn in the water (by the action of the water thereon) to a position transverse to the rims of the wheel, for the purposes and substantially as described.

No. 27,795.—CHARLES S. GRAVES, of Elyria, Ohio.—*Improvement in Horse Powers*.—Patent dated April 10, 1860.—This invention consists in providing upon the wheel that communicates the power and motion, a corrugated rim or edge, also a combination of friction rollers connected with the vibrating lever, which rim, by means of rollers, is brought in immediate connection with the end of the lever, thus dispensing with gearing and intermediate mechanism.

Claim.—The combination of the lever to be vibrated with the scalloped or corrugated edge of the driving wheel, substantially as set forth.

No. 27,796.—A. HAMMOND, of Jacksonville, Ill.—*Improvement in Ploughs*.—Patent dated April 10, 1860.—The object of this invention is to construct the machine in such a way that the standard for carrying the tooth or shoe may be adjusted longitudinally with the beam of the machine.

Claim.—The combination, with the standard D, of the movable plate J, adjusting set screw L, and friction rollers G G, arranged as set forth, so as to regulate the depth for forming the drain, and at the same time to facilitate the removal of the shoe from the ground.

No. 27,797.—HEMAN B. HAMMON, of Bristolville, Ohio.—*Improvement in Cultivator Teeth*.—Patent dated April 10, 1860.—In this invention the operator can set the arms at such angles that the forward blades will carry the soil from the centre between the rows each way,

so that the two back blades will carry the same soil to the hills, and the necessity of hilling up with a hoe be dispensed with.

Claim.—The employment of the grooved plate C in combination with a frame A and reversible arm B, having a projection *a*, as and for the purpose shown and described.

No. 27,798.—CHARLES T. HARRIS, of New Brunswick, N. J.—*Improvement in Vulcanizing Caoutchouc.*—Patent dated April 10, 1860.—This discovery consists in the combination of the gum to be cured with the sulphide of bismuth prior to heating the same to a temperature at which the curing takes place.

Claim.—The means, substantially as described, of curing India rubber and analogous gums, by combining them with an artificial sulphide of bismuth and heating the compound.

No. 27,799.—D. S. HARRIS, of Galena, Ill.—*Improved Spark Extinguisher for Steam Boilers.*—Patent dated April 10, 1860.—This invention consists in the use of a wire screen water trough, and water supply and discharge pipes, and also scrapers arranged inside of the smoke pipes of a furnace, so that the smoke and gaseous products of combustion will be readily allowed to escape and pass up the smoke pipe, while the sparks will be arrested, extinguished, and discharged from the lower part of the smoke pipe.

The inventor says: I *claim* the wire screens D, and troughs E, placed within the lower parts of the smoke pipes B, in connection with the proper water supply tubes F G, and discharge tubes *a*, substantially as and for the purpose set forth.

I further claim, in connection with the wire screens D, and troughs E, and water supply pipes, the scrapers H, as and for the purpose set forth.

No. 27,800.—EDWARD HATFIELD, of Brownsville, Pa.—*Improvement in Washboards.*—Patent dated April 10, 1860.—This invention consists in constructing the rubber of pottery, and inclosing the same in a proper frame to support it.

Claim.—As a new article of manufacture, a washboard with a rubber of pottery.

No. 27,801.—JOSEPH HIGGINBOTHAM, of Philadelphia, Pa.—*Improvement in Stop Valves.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The guide D, with its slot *m*, the cup C, and spindle B, with its two slots crossing each other, in combination with the spindle H, and its cam G, when a part of said guide forms, in conjunction with the cap C, a stuffing box for the spindle B; and when the several parts are arranged in respect to each other and to the body of the valve, substantially as specified.

No. 27,802.—ANDREW HILLS, of Naugatuck, Conn.—*Improved Culinary Fork and Spoon.*—Patent dated April 10, 1860.—This invention consists in combining two ladles, or spoon shaped tongs with a fork, and in constructing them of two pieces of suitable steel wire bent up in a novel manner and attached to a handle that a guide and tongue are formed for preventing the lateral movement of the ladle arms.

Claim.—The double ladle C C, tongue and eye E E¹, springs G G, handle B, and fork J, when the same are constructed and arranged as represented and described—constituting a new article of manufacture.

No. 27,803.—ANSEL HOWARD, JR., of Readsborough, Vt.—*Improved Machine for Making Wooden Ware.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the arrangement and combination of the two curved guides L L, and a shaft K, applied, as described, to a vertically moving frame, supporting cutters applied to it, substantially as specified.

I also claim the mechanism for rounding the external surface of the block or tray, or preparing such with a flat bottom and round sides and ends, the said mechanism consisting of the plane, the curved guide grooves and switches, arranged so as to operate substantially as specified.

No. 27,804.—DAVID HOWELL, of Louisville, Ky.—*Improved Trip Hammer.*—Patent dated April 10, 1860.—This invention consists in the employment for the lifting device of a trip hammer, of a cone cam constructed and arranged to slide on its driving shaft across that portion of the hammer on which the cam is brought to bear, and adapted through a lever, or screw, and a clutch, between whose sides it is laterally confined, to receive movement and adjustment while in motion, so that the lift and force may be graduated.

Claim.—The arrangement of the sliding conical cam F, feathered shaft E, sliding clutch G, rod H, and hammer C, when the parts are constructed, combined, and adapted in the manner set forth, to admit of varying the stroke of the hammer while in operation.

No. 27,805.—JOSEPH CHARLES HOWELLS, of Madison, Wis.—*Improvement in Needle Guards*.—Patent dated April 10, 1860.—In operating this invention the edge of a handkerchief, or other article to be hemmed, is slipped under the marker or gauge C, and drawn along, pressing the cloth against the sharp edge of the gauge so as to mark a straight line across the handkerchief just where the stitch is to be made; then the edge of the handkerchief is put into the snail, or hemmer B, so as to form the hem and the stitching is commenced, care being taken to make the stitch follow the line.

Claim.—As a new article of manufacture, the combination of the needle guard A, and hemmer B, whether the stitching gauge or knife be used therewith, or not, substantially as set forth, for the purpose specified.

No. 27,806.—HENRY CHARLES HOWELLS, of New York, N. Y.—*Improved Head Supporting Apparatus for Harvesters*.—Patent dated April 10, 1860.—The inventor says: This instrument I make entirely of pieces of steel marked *a*, with the exception of the parts marked *b*, which I make of elastic or non-elastic suitable material. All the pieces are jointed by rivets; the instrument is extended to the required length by the series of levers marked *a*; all the joints can be at once made rigid, when the instrument is extended, or closed, by the thumb screw *c*.

Claim.—The above described head rest, as a new article of manufacture, substantially as specified.

No. 27,807.—MARTIN A. HOWELL, JR., of Ottawa, Ill.—*Improvement in Corn Planters*.—Patent dated April 10, 1860.—This invention relates to a seed dropping device, whereby the seed may be dropped evenly or uniformly, and without the device used for the purpose becoming clogged, the device also working with but little friction and consequently but little wear and tear.

The inventor says: I *claim*, first, the employment or use of rocking seed cups E E, placed within or above the seed boxes D D, and provided with seed cells *f*, and flaps or valves *h*, or their equivalents, to operate as and for the purpose set forth.

Second. In combination with the rocking seed cups E E, and seed boxes D D, the slides or cut-offs G, operated from the rocking cups E E, substantially as and for the purpose set forth.

No. 27,808.—WILLIAM D. IVEY, of Milford, Ga.—*Improvement in Ploughs*.—Patent dated April 10, 1860.—This plough can be adjusted so as to cut deep or shallow, by screwing up, or unscrewing the nut *f*, which fits on the adjusting piece F.

Claim.—The combination and arrangement of the guard blade I, the wheel G, the plough D, frame E, and draft beam A, substantially as set forth.

No. 27,809.—JOSEF JOHNSON, of New York, N. Y.—*Improved Washing Machine*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of an inclined washboard A, with the revolving disk E, which is parallel to and capable of sliding towards and from A, by the action of the same hand which operates it, substantially as and for the purposes set forth.

No. 27,810.—MATHAUS KAEFER, of New York, N. Y.—*Improved Chucks for Cutting Disks of Paper, &c.*—Patent dated April 10, 1860.—This invention consists of a hollow revolving cutter for cutting disks of paper, (for boxes, &c.,) with an improvement added, by which the paper outside of the cutter is drawn inwardly or expanded by the action of a screw upon the same.

Claim.—The hollow cutter *b*, arranged with screw threads around its outer surface, all substantially as set forth.

No. 27,811.—JOSEPH KEECH, of Waterloo, N. Y.—*Improved Washboard*.—Patent dated April 10, 1860.—This invention consists in the peculiar form given to the corrugations, or crimp of the rubbing surface or zinc plate, they being formed into an obtuse angular shape longitudinally, containing three angular points in the length of the crimp which extends from side to side of the frame crosswise.

Claim.—The obtuse angular shape given to the crimp or corrugations, longitudinally, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 27,812.—JOHN E. KELLY, of New York, N. Y.—*Improvement in Mangers*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The movable bottom to mangers and feed boxes, supported in such manner that they may be depressed to receive the given quantity of feed, and are raised and kept to the rack or bars by means of springs or weights, or their equivalents, in combination with a

feeding rack made horizontal or nearly so, in the manner described, and for the purposes specified.

No. 27,813.—LEONARD KILE, of Williamsfield, Ohio.—*Improvement in Upsetting Tire*.—Patent dated April 10, 1860.—A is an anvil block of cast iron, with a horn B shaped like a letter u projecting from its side. The upper face of the anvil is made concave from G to H; C D E F are keys, or wedges shaped like C, these fit in corresponding holes in the anvil A.

Claim.—The employment of the wedges C D E F, in combination with the concave faced anvil A, as and for the purpose shown and described.

No. 27,814.—MARCUS LAVEEN, of Moorefield, Va.—*Improved Fly Brush or Fan*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of a ratchet wheel B¹, vibrating lever G, notched wheel K, fly wheel O, two spiral springs F P, and one or more fans A A, for the purpose of imparting a vibratory motion to the fan or fans, and thus creating an artificial motion of the air, substantially as set forth.

No. 27,815.—JOHN K. LEMON, of Toledo, Ohio.—*Improvement in Builders' Scaffolds*.—Patent dated April 10, 1860.—The uprights A are of quadrilateral form, and on each upright the rectangular metal bands C are placed, these bands are made of flat bars and are considerably longer than the uprights, sufficiently so to admit of a wedge-shaped block D being inserted in them.

Claim.—The employment of the slotted wedge blocks D, in combination with bands C, pins b, and uprights A, as and for the purpose shown and described.

No. 27,816.—DAVID C. LYALL, of New York, N. Y.—*Improvement in Supporting Window Sashes*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement and use of the lever or bar m, slitted bearings s s, on both sides of the sashes, straight flat spring v, in combination with the triplet crank c c c¹, as applied to operating window sash, substantially as described and shown in the drawings.

No. 27,817.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improvement in Substitutes for Emery Cloth*.—Patent dated April 10, 1860.—The claim explains the nature of this invention.

Claim.—The new article of manufacture, as a substitute for emery cloth, emery paper, or sand paper, the same consisting of a sheet of India rubber or gutta percha, of any desired thickness, with which emery or sand is incorporated and combined, cemented to a sheet of cloth or paper, or other backing, and subjected to heat, substantially as described, for the purpose of polishing, sharpening, or other similar purposes.

No. 27,818.—THOMAS J. MAYALL, of Roxbury, Mass.—*Improved Artificial Slate*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an article of manufacture, a slate produced in the manner described, by combining in one piece and without seam or joint, the frame made of soft or elastic rubber or gutta percha, and the tablet formed of rubber or gutta percha, with which emery or sand, or other gritty material is incorporated, and constituting a comparatively hard and rigid substance, as set forth.

No. 27,819.—CHARLES MCBURNEY, of Roxbury, Mass.—*Improvement in Hose Tubing*.—Patent dated April 10, 1860.—The claim explains the nature of this invention.

Claim.—A hose for conveying liquids, having a woven fibrous exterior and a vulcanized India rubber interior, with an interposed layer of unsulphured rubber, as set forth for the purpose specified.

No. 27,820.—GEORGE B. MICKLE and J. M. CARVILLE, of New York, N. Y.—*Improved Truck for Fire Ladders*.—Patent dated April 10, 1860.—This invention consists in arranging the two parts of the truck with suitable sockets to receive the ends of the connecting beam or perch, so that the latter can be disconnected from one or both parts of the truck at pleasure; in arranging the wheels of the front part of the truck with suitable sockets in the hubs and with loops on the rims in such a manner that by inserting suitable bars into said loops and sockets the wheels are prevented from turning, keeping the front part of the truck from slipping while the ladder is raised and lowered; and also in combining a windlass at the lower end of the ladder with the front part of the truck in such a manner that by means of the windlass and the aid of the truck the ladders are raised and turned in any direction.

The inventors say: We claim, first, the arrangement of the sockets f, at the two parts B C

of the truck, in combination with the perch D, constructed and operating substantially as and for the purpose described.

Second. The arrangement of the loops *h*, and sockets *i*, on the wheels of the front part of the truck, to operate in combination with the crow bars E, substantially in the manner and for the purpose specified.

No. 27,821.—GEORGE B. MICKLE and J. M. CARVILLE, of New York, N. Y.—*Improved Extension Ladders*.—Patent dated April 10, 1860.—The object of this invention is to arrange a series of ladders in such a manner that they can be readily extended to any length, when used in combination, and be detached from each other with facility and used as occasion may require.

Claim.—In combination with the drums D E, on the shaft *a*¹, the ladders A B C, sliding strips *e*, and stops *f f*, substantially in the manner and for the purpose specified.

No. 27,822.—ISAAC MOTT, of Glenn's Falls, N. Y.—*Improvement in Laying Slate Roof*.—Patent dated April 10, 1860.—This invention consists in so laying rectangular slate on the roofs of houses that the side edges of the first diagonal course shall overlap and underlap one another about one third their width, and the lower edges of the second course overlap the upper edge of the first diagonal course about one third of the depth of the slates, and the side edges of said second course at the same time overlap and underlap one another, and so on until the roof is covered in a manner to expose nearly two thirds of the surface of each slate and present irregular courses.

Claim.—The peculiar method described and shown of laying rectangular slate on the roofs of houses, &c., for the purposes set forth.

No. 27,823.—DAVID NEEDHAM, of Oskaloosa, Iowa.—*Improvement in Tanning*.—Patent dated April 10, 1860.—The preparatory composition used in this invention is of the following ingredients and proportions: Hempseed, 1 peck; hops, 1 pound; sal soda, $\frac{1}{4}$ pound; animal brain, $\frac{1}{4}$ pound; boiled in eight gallons of water. After the hides are soaked in this liquor a proper length of time they are put in a tanning liquor consisting of catechu, divi-divi, alum, and salt, mixed together.

Claim.—The described process of tanning, consisting in the application to the hides of a solution composed of the specified materials, mixed in about the proportion specified, preparatory to treating them with the tanning liquid.

No. 27,824.—MORTIMER NELSON, of New York, N. Y.—*Improvement in Riding Saddles*.—Patent dated April 10, 1860.—4 4 are slides on the saddle tree *a*, receiving the cross piece *e*, in the ends of which the springs *f* rest; *d* is a screw operated from the back part of the saddle by which the springs *f* are moved nearer to or further from the pommel of the saddle, as the case may require.

Claim.—The arrangement of the two springs *f*, of rubber or equivalent material, the cross piece *e*, and screw *d*, in the manner and for the purposes specified.

No. 27,825.—J. M. PATTERSON and J. F. MORRELL, of Woodbury, N. J.—*Improved Washing Machine*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the metallic, hollow, air-tight corrugated cylinder A, and the metallic concave and corrugated bottomed case or tub B, the same being constructed and arranged together in the manner and for the purpose set forth and described.

Second. We also claim giving the semi-rotary oscillating motion to the cylinder A, when the same is suspended over the concave B, as described, by means of the levers *l l*, cords *n n*, pulleys *j j*, hand levers *m m*, and the springs *o o*, the same being constructed and arranged in relation to each other on the machine, in the manner set forth and described.

No. 27,826.—JACOB L. PAXSON, of Norristown, Pa.—*Improvement in Harvesters*.—Patent dated April 10, 1860.—J is a vibrating rack having teeth *j* for giving an oscillating motion to the knife or knives G. K is a plate which covers the knife rack J and knives G to protect them from dust, &c. L L are bars which are hung at the upper end by the axle B, and are connected at their lower end with the finger bar E. M is a guard of the finger bar E and lever Q; it is fastened by means of bolts on the under side of the bars L.

The inventor says: I *claim* the combination of the forked lever Q, and yokes R R, with shaft B, and the cutting apparatus, the parts being constructed, arranged, and operated in the manner and for the purpose specified.

Also, the peculiar manner of connecting the platform frame with the main frame (which is supported by the wheels C D) by the bars L L, and the bolts *h i*, the parts being arranged and connected in the manner and for the purpose substantially as set forth.

No. 27,827.—W. H. PEASE, of Goshen, Ind.—*Improved Machine for Curving Marble, &c.*—Patent dated April 10, 1860.—This invention consists in the employment of a system of levers known as lazy tongs, provided with an index and cutter.

Claim.—The levers *g h n*, arranged, as shown, to form the lazy tongs, provided within the joint *D*, and the arbors *H G¹*, operated from the driving shaft by means of the gear and belts, substantially as and for the purposes set forth.

No. 27,828.—JOHN G. PERRY, of South Kingston, R. I.—*Improved Sausage Stuffer.*—Patent dated April 10, 1860.—The operation of this machine is as follows: By turning the crank, the lever gear on the shaft *G* causes the plate *B* to revolve, and that turns the smaller wheel *C* by the studs *o o* meshing into the recesses of it; as the meat is put into the hopper it falls on the plate *B*, and is carried in between the wheel *C* and the studs *o o*; and as it approaches the point where the studs enter the recesses of the smaller wheel *C*, it is pressed through between the studs into the pipe, and out through into the cases which are placed upon it.

Claim.—Combining the plate or wheel *B* with the tube *H*, substantially as described and for the purposes set forth.

No. 27,829.—SALMON R. PLUMB, of Southampton, Conn.—*Improved Sausage Stuffer.*—Patent dated April 10, 1860.—This invention consists in the arrangement of a right and left screw on the same shaft, operating by turning it within a suitable case, and a slotted sliding plate, to receive and readily force the cut meat within the sausage skin.

Claim.—The arrangement and combination of case *A*, revolving right and left handed screw *B*, and sliding plate *C*, essentially in the manner and for the purposes fully set forth and described.

No. 27,830.—EUGENE POWELL, of Conneautville, Penn.—*Improvement in Cane Presses.*—Patent dated April 10, 1860.—In the upper part of the frame *A* a cylinder *B* is placed, the journals *a* of which are fitted in permanent bearings in the frame *A*. On the outer end of each journal a toothed wheel *C* is placed; the wheels *C* gear into the pinions *D* at the ends of the cylinders *D¹*, the journals *b* of which are fitted in curved or segment bars *E*, one at each side of the frame *A*. At each side of the frame there is secured a semi-circular plate *E*, which extend down below the upper parts of the ends of the cylinder *D¹*.

Claim.—The combination, with the basin *F*, plates *E¹ E¹*, cylinders *D¹*, and cylinder *B*, of the curved plate *G*, when provided with tubes *H*, as and for the purpose shown and described.

No. 27,831.—CURT PRETSCH, of Trenton, N. J.—*Improved Reading and Writing Desk.*—Patent dated April 10, 1860.—This invention relates to a portable reading and writing desk, to be attached to the side of a bedstead rail, to a chair, or other like article of furniture, for the use of invalids or those who are not able to hold a book constantly.

Claim.—The combination of the adjustable ledge *J*, strip *E*, and tablet *D*, with the drawer *C*, box *A*, rack box *B*, bracket *L*, and adjustable rod *M*, as and for the purpose shown and described.

No. 27,832.—LEWIS C. REESE, of Phillipsburg, N. J.—*Improvement in Harvesters.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the arms *G*, provided respectively with bars *I*, and one or more rakes *I¹*, with swivels *d*, connected by joints *c* to a rotating shaft *E*, and by friction rollers or other suitable means to guide *H*, to operate as set forth.

Second. The employment or use, in connection with the guide *H*, of the slotted arms *F*, attached to the shaft *E*, and arranged, as described, to receive the arms *G*, and retain the same in a proper relative position with each other, and arranged for adjustment, substantially as described.

No. 27,833.—ANDRE SABATIER, of New York, N. Y.—*Improved Varnish.*—Patent dated April 10, 1860.—The component parts of this invention are as follows: Alcohol $1\frac{1}{2}$ pints, spirits of turpentine $1\frac{1}{2}$ gills, alkanet 1 ounce, sulphate of iron 1 ounce, gum benzoin 1 ounce, gum sandarac 4 ounces, and $\frac{1}{4}$ ounce of lamp black.

Claim.—The varnish composed of the several ingredients specified, in about the proportions set forth.

No. 27,834.—JACOB SCHAEFER, of Henderson, Ky.—*Improvement in Grain Separators.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Having the rear end of the first chaff riddle attached to a revolving crank shaft *K*, and its front end hinged to a suspended swinging frame, which contains a second chaff sieve and a grain sieve, substantially as and for the purposes set forth.

No. 27,835.—L. K. SELDEN, of Haddam, Conn.—*Improved Childs' Cradle.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a cradle body made of suitable strips jointed together and capable of being folded up, as described and represented.

Second. The rockers B B, composed of pieces B¹, arranged and applied so as to serve the two-fold purpose of a brace and spring, as set forth.

No. 27,836.—D. P. SHARP and L. MOOD, of Ithaca, N. Y.—*Improved Washing Machine*.—Patent dated April 10, 1860.—This invention consists in the employment of one or more pumps placed in a proper box or case, and used in connection with a press to receive the clothes, the press being placed in the same box or case with the pump, and the pump cylinders connected with the press by a suitable pipe.

The inventors say: We *claim* the force pump B, one or more, in combination with the clothes press formed of the box F and follower H, the pumps and clothes press being placed within a case or box A, and all arranged to operate substantially as and for the purpose set forth.

We further claim the ledges *d f*, respectively, on the bottom G, and follower H of the press, when used in connection with the pumps B, for the purpose specified.

No. 27,837.—C. F. EDWARD SIMON, of Washington Town, N. J.—*Improvement in Restoring Waste Vulcanized Rubber*.—Patent dated April 10, 1860.—The claim explains the nature of this invention.

Claim.—The mixing of the ground, or cut, or torn waste of vulcanized India rubber with chloride of lime, in the manner described, and the exposing of the same to a heat of 900°–1,200° Fah. for the time and in the manner substantially pointed out.

No. 27,838.—HENRY SIMON, of Providence, R. I.—*Improved Shirt Stud*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the movable hooklike shank *b*, applied to slide in a slot in the back of the head, and the spring *c* applied to the said shank, to operate as described, in combination with the fixed hooklike shank *b*.

No. 27,839.—ROBERT A. SMITH, of New York, N. Y.—*Improved Machine for Sweeping Streets*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, hanging the main broom shaft G, in swinging arms H H, from the axle C³, so that said shaft will have a direct motion from the driving wheel C², substantially as set forth.

Second. In combination with the main broom shaft, hung as set forth, I claim the rods *c*, arms *a a*¹, shaft *b*, and rod I, connecting with the lever I¹, for the purpose of enabling the driver to raise or depress this broom shaft at pleasure, as set forth.

Third. I claim giving to the main broom shaft G a yielding action, so that it will adapt itself to the inequalities of the street surface, whether effected by the arrangement of arms and connecting rods and springs *e e*, as described, or in any other way, substantially as described.

Fourth. I claim the universal coupling of the main broom shaft with the adjustable hanger 8, for the purposes substantially as set forth.

Fifth. I claim the adjustable hangers 1 1, with the chain pulleys 5 5, and secondary broom shaft, when the same are arranged in relation to the pan N, or its equivalent, as described and represented, for the purpose of adjusting the brush shaft and keeping the brush in contact with this pan, at the same time to tighten up the chain as it wears loose on the pulleys.

Sixth. I claim the adjustable swinging trap or box L, suspended over the main brooms and in rear of the same, for the purposes and substantially as described and represented.

Seventh. I claim arranging in front of the secondary broom cylinder, and in a suitable relation with the conducting pan N, a dirt receiver R, supplied by any suitable mechanism by which the box may be emptied of its contents at suitable intervals.

Eighth. I claim the guard board T, placed between the front and rear brooms, for the purposes and as described and represented.

No. 27,840.—E. S. SNELL, of North Bridgewater, Mass.—*Improvement in Edge Planes for Boots and Shoes*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The detachable blade C, with a curved moulded face *e*, when the same is made adjustable on the curved top of the shank B, substantially as described.

No. 27,841.—N. T. SPEAR, of New York, N. Y.—*Improvement in Corn Huskers*.—Patent dated April 10, 1860.—In the lower vibrating end of the apron G is a roller N, the axis of which is parallel to that of the cylinders C E. The roller N is quite small, and between this and the cylinders the ears of corn are held while the husks are stripped off.

Claim.—Providing the lower extremity of the hinged yielding apron G with one or more

rollers N, arranged as described, and operating in combination with the husking cylinders C and E, in the manner and for the purpose specified.

No. 27,842.—D. S. STOMBS, of Newport, Ky., and JULIUS BRACE, of Point Creek, Va.—*Improvement in the Distillation of Coal Oil*.—Patent dated April 10, 1860.—This invention consists in separating from the crude oil the various products contained therein, by volatilizing it over the surface, or upon, as it were, a bath of the fluid having a higher specific gravity, and heated to a degree of temperature at which the fluid to separate from the crude oil volatilizes.

Claim.—The herein described process of redistilling crude oil or other oils, by means of an apparatus constructed on the principle substantially as specified.

No. 27,843.—GEORGE A. STONE, of Roxbury, and JAMES A. WHIPPLE, of Boston, Mass.—*Improved Steam Boiler*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of tubes sloping upward, and arranged in rows relatively to each other, substantially as specified, with water spaces connecting with these tubes and substantially surrounding a vertical tube box, the combination being substantially as described, for the purposes specified.

Second. We claim combining the shell of a boiler with the heating surface *d*, or evaporating surface thereof, by means of a stuffing box and a joint, substantially such as are specified, for the purposes set forth.

Third. We claim combining with the boiler shell an inside lining of wood, or other non-conducting material, arranged therein substantially in the manner and for the purposes described.

Lastly. We claim, in combination with a tube box, supporting tubes, arranged substantially in the manner described, and the steam space of a boiler, a foam plate, arranged substantially in the manner set forth, for the purpose described.

No. 27,844.—A. B. STROUP, of Waldron, Ind.—*Improved Bed Cord Tightener*.—Patent dated April 10, 1860.—This invention consists in the arrangement and combination of parts, by which the operator is enabled to cord any ordinary bedstead with facility as tight as may be desired.

Claim.—The combination and arrangement of the plates A and B, tube C, wheel E, hooks F, spring H, substantially as and for the purpose specified.

No. 27,845.—MYRON E. TAFT, of Potsdam, N. Y.—*Improvement in Cheese Presses*.—Patent dated April 10, 1860.—This invention consists in making the cross head and the table vertically adjustable, and in connecting with the cross head, in the employment of a jointed bar arranged along one side of the head, having curved arms, which, with similar arms on the opposite side of the head and fixed to it, the cheese hoop may be secured in place on the table, and the machine adapted to receive various sizes of hoops.

Claim.—The combination, with the adjustable cross head and table, of the fixed and movable holding arms J J, and horizontal pressing screws G G, all arranged as and for the purpose set forth.

No. 27,846.—HENRY UNDERWOOD, of New York, N. Y.—*Improvement in Belting*.—Patent dated April 10, 1860.—This invention consists in the employment of a belt of trapezoidal shape, in connection with an angular grooved pulley, whereby a greater surface of the belt is brought in contact with the sides of the groove than with either the round or flat belt.

Claim.—The trapezoidal belt for machinery, as described and represented, forming a new article of manufacture.

No. 27,847.—CHARLES L. VASQUEZ, of Philadelphia, Pa., assignor to R. H. GRATZ, of said Philadelphia.—*Improvement in Dry Gas Meters*.—Patent dated April 10, 1860.—This invention consists in forming between the bevel of the valve seat and the measuring compartments, a chamber and inlet pipe arranged so as to convey the gas to the central opening of the valve seat, and so as to afford a means of drawing off the condensed vapor without encroaching upon the necessary space occupied by the measuring chambers, and without interfering with the proper action of the diaphragms.

Claim.—Forming between the level of the valve seat and the measuring compartments of a dry gas meter, a chamber D, and an inlet pipe G, communicating with the same, both pipe and chamber being arranged in respect to the plate A, substantially as and for the purpose set forth.

No. 27,848.—WILLIAM F. WARBURTON and C. E. LOVETT, of Philadelphia, Pa.—*Improvement in the Manufacture of Hats*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The process of attaching the lining to the interior of the hat by means of an elastic cement simultaneously with the finishing of the exterior of the hat, as set forth.

No. 27,849.—BURGAN B. WESCOTT, of Camden, Ind.—*Improved Washing Machine.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the tub A, support H, lever F, standard E, and rods *a a*, with the rubber D, and spring C, when said spring is so secured between the lever and the rubber, that increased pressure will be added to the said rubber, as the rods *a a* assume a greater inclination, and when it assists in returning the rubber to its normal position, and elevating the levers, substantially as specified.

No. 27,850.—JOHN L. WHETSTONE, of Cincinnati, Ohio.—*Improvement in Running Gear of Locomotive Engines.*—Patent dated April 10, 1860.—E is the vibrating truck frame, and F F the truck wheels. The front end of the truck frame contains the boxes for the axle G of the wheels F forming the base of the triangle, and the rear end is connected with a strong cross bar H, whose ends are connected by hangers *b b* with the spring *c² C²* of the forward drivers.

Claim.—The combination of the truck frame E, with the springs *C²* of the front drivers substantially as and for the purpose shown and described.

No. 27,851.—JOHN WILLIAMS, of Kalamazoo, Mich.—*Improvement in Machines for Weighing Grain.*—Patent dated April 10, 1860.—When this machine is in operation the grain passes through the chute until the hopper receives the necessary quantity to depress it sufficiently to drop the rim *d* below the stop *f*; this permits the hopper to revolve 180°, discharge its contents, and be again stopped by the stop *f* entering the opposite opening *d*.

The inventor says: I *claim*, first, the revolving hopper H, in combination with the bar D, connected with beam weights W, at the extremities of cords *k*, and the attachment of said cords to the valves, substantially as specified, so as to regulate the cutting off of grain by the weighing operation without making the proper action of the hopper dependent on the successful operation of the cut-off.

Second. The adjustable stop *f*, in combination with the openings *e*, in the rim *d*, bar D, adjustable stop *t*, scale beam and weight, arranged and operating substantially as and for the purposes set forth.

No. 27,852.—BENNETT F. WITT, of Dublin, Ind.—*Improvement in Harvesting Machines.*—Patent dated April 10, 1860.—This invention consists in the construction and arrangement of a supplementary carriage coupled loosely to the side of a harvesting machine, for the purpose of carrying one or more binders, the said carriage being supported at one side upon its own wheels, so as to be adapted to accommodate itself to the undulations in the surface of the ground and compensate for the side draft of the machine.

Claim.—The two wheel binder's carriage H, constructed, arranged, and connected in the manner described, with the reaping machine adapted for side delivery, the parts operating in combination, substantially as and for the purposes specified.

No. 27,853.—CALVIN WOODWARD and GEORGE M. WOODWARD, of New York, N. Y.—*Improvement in Feed Water Apparatus for Steam Boilers.*—Patent dated April 10, 1860.—C is the cylinder which fits nicely into the jacket, being retained in the same by the nuts *e*, which screw up steam tight against the edges of the jacket. The interior of this cylinder is smooth and open at both ends. Three pistons D, E, F, which are secured to a common piston rod G, at equal distances from each other, work steam tight in said cylinder, and the piston rod connects by means of a connection rod *f*, with an eccentric wrist pin *g*, on a disk *h*, to which a rotary motion is imparted from some part of the engine.

Claim.—The arrangement and combination of the three pistons D, E, F, and rod G, with the perforated cylinder C, and jacket B, as and for the purpose shown and described.

No. 27,854.—WILLIAM E. WORTHEN, of New York, N. Y.—*Improved Lock.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of an oscillating or revolving tumbler, such as described, with a door, bolt, and locking slide, substantially such as specified, the whole operating substantially as set forth.

And, in combination with a bolt and tumbler, substantially such as specified, I claim the notches *h h¹*, and a stud *g*, or their equivalents, for limiting the range of motion of the tumbler.

No. 27,855.—JOHN WYBERD, of New York, N. Y.—*Improved Night Light Reflector.*—Patent dated April 10, 1860.—This invention consists in suspending over the burner a reflector of octagonal shape, composed of a series of metallic plates, each series decreasing in circum-

ference and placed above each other and connected by standards of iron or wire, leaving the space between them open for ventilation. The surfaces of the plates are also corrugated so as to assist in diffusing the light.

Claim.—The dome-like arrangement of a system of corrugated reflectors, with alternate ventilating spaces, as set forth.

No. 27,856.—JOSEPH ZEIGLER, of Baltimore, Md.—*Improved Alarm Lock.*—Patent dated April 10, 1860.—This invention consists in controlling the opening of the cash drawer by means of a treadle attached to the floor, and combining at will with a bell trigger in such a manner that the drawer cannot be opened without an alarm being sounded.

The inventor says: I *claim* controlling the opening of a drawer by means of a treadle operated by the foot, substantially in the manner described.

I also claim connecting or disconnecting, at will, the treadle which controls the drawer with an alarm bell, substantially in the manner and for the purpose set forth.

No. 27,857.—AUGUSTUS C. CAREY, of Lynn, Mass., assignor to himself and JOSEPH STORY, of Boston, Mass.—*Improvement in the Manufacture of Bank Notes.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The improvement in the manufacture of bank notes, checks, bills of exchange, &c., which consists in uniting two or more layers or sheets of paper or other suitable material, upon or through one or more of which layers or sheets distinctive letters, figures, or configurations have been previously formed, either by puncturing one or more, but never the whole, of the said layers or sheets, or by printing, coloring, or otherwise making distinctive marks upon either of the inner surfaces of the said layers or sheets.

No. 27,858.—EDMUND B. CHEREVOY, of New York, N. Y., assignor to himself and THOMAS W. WEATHERED, of said New York.—*Improvement in Boilers for Hot Water Apparatus.*—The invention consists of a series of hollow flat water chambers arranged around the inside of a dome shaped boiler, formed by a double casing containing water.

Claim.—The radial water chambers *k k k*, arranged within the conical water casing, as set forth, when connected to the said casing or dome by the screw thimbles, as specified.

No. 27,859.—JAMES CONNELL, of Port Huron, Mich., assignor to himself, CHRISTIAN CONNELL, and WILLIAM CONNELL, of said Port Huron.—*Improvement in Concentrated Extracts for Tanning Purposes.*—Patent dated April 10, 1860.—The object of this invention is the production, as an article of manufacture and commerce, of a concentrated aqueous extract of the tanning and coloring principles contained in trees and shrubs, that will resist the action of the atmosphere, and will not be liable to ferment or decompose.

Claim.—As a new article of manufacture, a concentrated aqueous extract of the tanning and coloring principle contained in trees and shrubs, when prepared substantially in the manner described.

No. 27,860.—JAMES C. COOKE, of Middletown, Conn., assignor to the RUSSELL MANUFACTURING COMPANY, of said Middletown.—*Improvement in Looms.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application of a friction clamp or apparatus to each or both rollers carried by the rocker levers, and operating the said levers by cams, substantially as described.

I also claim the combination and arrangement of one or more guide rollers or rods *a b*, with the two rollers *L M*, and their supporting levers, the same being to operate in manner as specified.

No. 27,861.—J. F. FULLER, of Louisville, Ky., assignor to himself and JOSEPH LANDES, of said Louisville.—*Improvement in Casting Door Numbers.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Forming ribs or projections *a a* on the backs of letters, numerals, symbols, or ornamental designs of any description, in such a manner that they may be clamped and held by a bar or by bars *B B*, in suitable combinations, while an impression in sand or other material is taken, and then removed from the bar or bars, and others introduced at pleasure, substantially as and for the purposes described and represented.

No. 27,862.—CHARLES A. GALE, of Boston, Mass., assignor to himself and SPENCER RUSSELL, of said Boston.—*Improved Automatic Mosquito Fan.*—Patent dated April 10, 1860.—The inner end of the staff projects between two cams *F G*, arranged on opposite sides of a shaft *H*, and supported by two disks *I I* fixed to such shaft. These cams, while the shaft is in revolution, operate alternately on the flag staff, so as to first move it horizontally in one direction, and next in the opposite.

Claim.—Improved arrangement of the fan or flag staff, the reversed cams, the cam shaft, and the clock-work mechanism for effecting the rotations of such cam shaft, the whole being made to operate substantially as described.

No. 27,863.—PHILETUS W. GATES, of Chicago, Ill., assignor to himself, THOMAS CHALMERS and D. R. FRASER, of said Chicago.—*Improvement in Crushing Rollers for Sugar Mills.* Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Making a portion of the surface of the rollers A A¹ B concave circumferentially, substantially as and for the purposes set forth.

No. 27,864.—EDWARD LYNCH, of Buffalo, N. Y., assignor to himself and JAMES J. McCool, of said Buffalo.—*Improved Churn.*—Patent dated April 10, 1860.—H is the break; it consists of a central ring *h*¹, having radial arms *h*², which extend from the ring to the sides of the churn; vertical grooves *i* are made in the sides of the churn to receive the ends of these arms when the breaker is put into the churn so that it will not revolve when the dash blades are put in motion.

The inventor says: I *claim*, first, the floating break H, constructed with a vertical ring *n*¹, and bevelled radial arms *h*², operating in combination with vertical grooves *i* in the sides of the churn, in the manner and for the purposes explained.

Second. The combination of the tube L and faucet M, constructed, arranged, and operating substantially as and for the purposes set forth.

No. 27,865.—THOMAS LINDSEY, of Lincoln, Ill., assignor to himself and J. H. BEIDLER, of said Lincoln.—*Improvement in Seeding Machines.*—Patent dated April 10, 1860.—The flexible tubes *p* are attached alternately to the tubes *q*, and to the lower end of each tube *q* a share D is attached. These shares are of double mould board form, and have inclined back edges to admit the earth to pass behind and fall into and fill up the furrows, and cover the seed therewith.

Claim.—The arrangement of the notched slide C, wheels *h*, oblique partitions *l*, seed cells *k*, tubes *q p*, and shares D, as and for the purpose shown and described.

No. 27,866.—JOHN McMURTRY, of Fayette County, Ky., assignor to FARMER DEWEES, of Lexington, Ky.—*Improved Mode of Securing Metal Hoops on Cotton Bales.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The bending of the ends of metal hoops or bales, substantially as described, for the purpose of making the fastening of the ends of the same, as shown in the accompanying drawings, for the purposes set forth.

No. 27,867.—WARREN MILLAR, of Chicago, Ill., assignor to himself and JOHN NUTT, of said Chicago.—*Improvement in Sewing Machines.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the bobbin case N, made up of the two curved disks *b b*¹, the one disk *b*, having a hollow female screw *d*, an eye or pulley *e*, and a hole *f*, and the other disk *b*¹, having a hollow male screw *g*, which allows of the passage of the thread, and in connection with the screw *d*, secures the disks to each other, as set forth.

And in combination with the bobbin case N, constructed as described, and a needle of a sewing machine, I *claim* the oscillating curved barbed looper P, having a groove *i*, at the base of its barb for the thread of the loop, and its point prolonged, as set forth.

No. 27,868.—FREDERICK D. NEWBURY, of Albany, N. Y., assignor to RICHARD V. DE WITT, JR., of said Albany.—*Improvement in Revolving Fire Arms.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the apparatus for enabling the hammer and trigger to be operated in concert with each other, whether the hammer be set by hand or by the trigger; viz: 1. The bar *f* attached to the hammer, and working along the side of the trigger, in order to catch into the pin *p*, in combination with the balance catch lever *g*, operating as described. 2. Also the pin *d* in bar *f*, operating through the slot *t*, and in combination with it and spring *u*, or the mechanical equivalents for said apparatus, the whole operating together in manner and for the purposes set forth.

I also *claim* the combined action of the trigger and pin *k*, with lever V, in operating the cylinder, so that when the lever has turned the cylinder to bring a chamber in it and the barrel to coincide, the toe or front point *a* of the trigger shall, jointly with the pin *k* and lever V, hold the cylinder during the discharge of the piece, in the manner shown and described.

No. 27,869.—SAMUEL RAY and M. R. SHALTERS, of Alliance, Ohio.—*Improvement in Mowing Machines.*—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the arrangement of the hinged bent lever M, segment rack N, sector O, curved rack Q, crank P, perforated pendants or guides *g g*, brace *i*, and finger bar S, the several parts constructed and combined in the manner and for the purposes described.

Second. The arrangement of the plate R with the pendants or guides *g g*, provided with notches *g¹*, finger bar S, and lever M, so as to admit of the turning back of the finger bar and sickle parallel with the frame A, by raising the finger bar and sickle, and at the same time admit of the finger bar and sickle being retained rigidly at right angles with the line of draft, when the machine is at work, substantially as set forth.

Third. The arrangement of the spring *t¹* with the yielding movable bar X, furnished with a pin *t*, in combination with the hollow perforated socket V *s*, and stationary bar W, in the manner described, so that the track clearer is capable of vibrating or yielding, and also may be easily adjusted without stopping the team, as set forth.

No. 27,870.—HENRY C. SMITH, of Cleveland, Ohio, assignor to ANSON SMITH, of said Cleveland.—*Improved Washing Machine*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—So arranging the tub that it may be actuated by means applied to its side, as set forth, in connection with a rubber that may be adjusted vertically, and so connected to the frame of the machine as to allow of its being turned out from the tub, as described.

No. 27,871.—WILLIAM H. TENDLER, of Cambridge, Mass., assignor to himself and JOHN F. MOESCHLIN, of said Cambridge.—*Improved Sofa Bedstead*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* constructing the bed foundation C, in two parts *e f*, and applying the part *e* to the seat B, and the rear half *f* to the front half *e*, so as to operate therewith and with respect to the sofa frame, as described.

I also claim arranging and combining a bed clothes space or receptacle *l*, with the seat B, and the bed foundation C, constructed and applied to the seat and the sofa frame, so as to operate as described.

No. 27,872.—FREEMAN WALCOTT, of Milford, Mass., assignor to himself and F. A. COFFIN, of Newburyport, Mass.—*Improvement in Board Roofing*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A roof covering formed of a double series of boards grooved over their entire surface, as set forth for the purpose specified.

No. 27,873.—CHARLES H. WARNER, of Brooklyn, N. Y., assignor to the BROOKLYN FLINT GLASS COMPANY, of said Brooklyn.—*Improvement in Glass Moulds*.—Patent dated April 10, 1860.—The claim and engravings explain the nature of this invention.

Claim.—I claim the mechanism for moulding glass for vault lights and other purposes, by which it is subjected to two consecutive pressures, one being applied for forcing or injecting and pressing the melted glass properly into the mould or moulds, and the other being applied during the cooling operation of the glass in the moulds, substantially as and for the purpose set forth.

I also claim the employment or use of a forcing or induction plunger H, or H¹, in connection with pressure plungers D D¹, and moulds *a a¹*, arranged to operate substantially as and for the purpose specified.

No. 27,874.—GEORGE P. FOSTER, of Providence, R. I.—*Improvement in Breech Loading Fire-Arms*.—Patent dated April 10, 1860.—This invention consists in the arrangement of a latch and catch in advance of the trigger, so that the latch may extend under the trigger and be movable with and have its fulcrum carried by the guard lever for operating the movable breech or charge holder.

Claim.—The arrangement of the latch F, and its catch G, relatively to the trigger, and the guard lever D of the movable breech part, as described.

No. 27,875.—WILLIAM W. HUSE, of Brooklyn, N. Y.—*Improved Steering Apparatus*.—Patent dated April 10, 1860.—This invention consists in the employment of one or more columns of water, or other non-compressible liquid, for the purpose of transmitting the motion of the steering wheel to the rudder; and also in arranging the wheel on a screw shaft connecting with a piston that moves in an air or water-tight cylinder, the ends of which connect by suitable tubes with two barrels furnished with plungers connecting with the arms of the tiller extending at opposite sides from the rudder head in such a manner that, when said cylinder is filled, the motion of the wheel in one direction or the other is transmitted to the rudder, no matter how far the distance between the wheel and the rudder may be.

The inventor says: I *claim*, first, the employment of one or more columns of water, or other liquid, for the purpose of transmitting the motion of the steering wheel to the rudder, substantially in the manner described.

Second. The arrangement of the cylinder E and barrels F F¹, in combination with the tiller g g¹ and wheel C, constructed and operating substantially in the manner and for the purpose specified.

No. 27,876.—WILLIAM C. ARTHUR, of Baltimore, Md.—*Improvement in Oil Cans*.—Patent dated April 10, 1860.—A is a spring constructed of a simple piece of wire of any desired form; one end of this spring is fastened to the side of the can b, the opposite end is left free. To the free end of the spring is attached a rod d, which passes through the opening in the top of the can and terminates in a button e. In the upper part of the spout a valve seat i is fixed; this valve seat is placed in such a position that when the two parts of the spout are brought into their proper places the leathered portion of the rod comes in close contact with it.

Claim.—The combination of the spring A, with the valve in the spout, arranged as above described.

No. 27,877.—STEPHEN M. ALLEN, of Niagara Falls, N. Y.—*Improvement in the Manufacture of Thread and Yarn*.—Patent dated April 17, 1860.—The claim explains the nature of this invention.

Claim.—The new article of manufacture, the same consisting in thread and yarn, made by combining ordinary short stapled fibrous materials like cotton or wool, with a short fibre prepared from long stapled fibrous materials, like flax, hemp, jute, silk, china, glass, and similar substances, by both the described mechanical reduction and chemical treatment referred to, so that when so combined they can be spun on the ordinary cotton and woolen machinery.

No. 27,878.—STEPHEN M. ALLEN, of Niagara Falls, N. Y.—*Improvement in the Method of Reducing Long Staple Fibrous Materials*.—Patent dated April 17, 1860.—The claim explains the nature of this invention.

Claim.—The method described of preparing long stapled vegetable fibrous material, for the purpose of spinning therefrom both coarse and fine yarn or thread, by combining the described mechanical reduction of the said fibre, with its chemical treatment, as set forth.

No. 27,879.—CALEB BATES, of Kingston, Mass.—*Improvement in Stump Extractors*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the employment of the crossed pawls E F, in combination with the rack bar G, head B, and levers C C, as and for the purpose shown and described.

I also claim the arrangement of the pivots or pins on which the pawls E F turn, above the plane of the bearing edges of the trunnions g g, so that the fulcra of the lifting levers will shorten as the levers descend, and the lifting power will be correspondingly increased.

I further claim the employment of the knife edged trunnions g g, in combination with the head B, and pendulous rods e e, as and for the purpose shown and described.

No. 27,880.—THOMAS H. BELL, of Washington, D. C.—*Improvement in Hanging Bells*.—Patent dated April 17, 1860.—This invention consists in constructing and combining the several parts of the apparatus in such a manner that by shifting their relative positions the apparatus will allow the pull wire, or wire which operates the bell, to run off in any desirable direction.

Claim.—Constructing and combining the several parts of the apparatus, substantially as before described, so as to admit of the "pull wire" running off in any desired direction.

No. 27,881.—WILLIAM A. BIRD, of Newark, N. J.—*Improvement in Sliding Carriage Seats*.—Patent dated April 17, 1860.—This invention consists in rendering the seat firm and quiet, yet easy to move by means of irons peculiarly constructed and adapted thereto.

The inventor says: I *claim* the steady pins, be they more or less than two, and the eye pieces, when constructed, arranged, and operated substantially in the manner and for the purpose set forth.

Also, the irons V and W, when used in connection with the steady pins, to insure the firmness of the seat.

No. 27,882.—ELI W. BLAKE, of New Haven, Conn.—*Improvement in Machines for Breaking Stones*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, constructing and supporting the fixed jaw of the said

machine for breaking stones in such manner that it can be inverted when worn, and confining it to its place by the check pieces, as described.

Second. Transferring the point of support and motion of the movable jaw from below to above its acting face, as described.

Third. The employment of the toggle block and wedge, as described, for the more convenient and precise adjustment of the size of the opening which determines the size of the fragments.

No. 27,883.—WILSON BOHANNAN, of Baltimore, Md.—*Improved Padlock*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the bolt C^1 on top of the bolt C , and pivoting the two together by means of a pivot a , and controlling the operation of the same by means of the two guide stops $D D^1$ and two springs $F^1 F^1$, in the manner and for the purpose described.

No. 27,884.—S. D. BOWKER, of Geneva, Ohio.—*Improvement in Self-detaching Whiffletrees*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the peculiar lever L , in combination with the ring G and the spring F , attached to the cylindrical box D , the said lever being provided with a raised part O and tongue N , and said ring with notches H and I , and slant or trimmed portion K , as described, and operating as and for the purposes set forth.

Second. I claim the employment of the hollow cylindrical box D , for holding and sustaining the bar or body of the whiffletree, so that it is free to turn therein; also, the mode of attaching the whiffletree to the doubletree, or the draw bar of the thills, by means of the shank E and screw nut, for the purpose of maintaining its ordinary horizontal movement, as described.

No. 27,885.—ROBERT P. BOYCE, of Erata, Miss.—*Improved Currying and Leather Dressing Machine*.—Patent dated April 17, 1860.—This invention consists in the employment of a rotating cylinder, pressure roller, and a reciprocating frame provided with a currying knife, polishing stone, and blacking brush, combined and arranged to effect the desired end.

Claim.—The rotating cylinder A and pressure roller P , or its equivalent, in connection with the reciprocating frame K , provided with the currying knife M , stone N , and brush O , arranged for joint operation as and for the purpose set forth.

No. 27,886.—THOMAS F. CARD, of Cincinnati, Ohio.—*Improvement in Fire Places*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the centre plate c , side plates $c^1 c^2$, slots e , pins f , supporting rods b , and pins, hooks, or staples a and d , the whole being constructed and combined in the manner set forth, to form a movable and adjustable deflecting plate, adapted to be applied at any height to a fire place of any dimensions.

No. 27,887.—JAMES M. CLARK, of Philadelphia, Pa.—*Improvement in the Bleaching of Grain by Sulphuric Acid*.—Patent dated April 17, 1860.—In the machinery described by the inventor for bleaching grain, A is a screen mounted upon suitable bearings, so that it may be revolved within the casing B . The bearing is in the wall of the casing, and the bearing D is of peculiar construction, so as to admit the grain to the screen from the spout E .

Claim.—The bleaching of wheat and rye, by exposing the same to the action of sulphuric acid gas, substantially as set forth.

No. 27,888.—EDWIN S. COLLINS, of Aspen Wall, Va.—*Improvement in Tobacco Presses*.—Patent dated April 17, 1860.—This invention consists in arranging the several parts of the press together.

Claim.—The arrangement of the lever F , the adjustable sword L , the arm R , and the cords $J K$, with the wheels $G H I$, and the sliding journal box O , when the same are connected together, operated, and used, substantially as and for the purpose specified.

No. 27,889.—HEZEKIAH CONANT, of Willimantic, Conn.—*Improvement in Looms*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of a whip roll of a loom with a belt guide, so that a belt may be shifted and the relative speed of a pair of cone pulleys may be made to differ as and whenever said roll is depressed, as set forth.

No. 27,890.—GEORGE COOMBS, of West Falls, N. Y.—*Improved Mangle*.—Patent dated April 17, 1860.—This invention relates to the construction and arrangement of the several

parts of the mangle, so that a heavily weighted box can easily be moved back and forth upon rollers over the clothes to be smoothed.

Claim.—The combination and arrangement of the weighted box *c*, windlass *F*, smoothing table *B*, and rollers *G*, with the frame *A*, for the purposes and substantially as described.

No. 27,891.—LOUIS DASER, of Washington, D. C.—*Improved Sextant*.—Patent dated April 17, 1860.—This improvement consists in a device by which a series of observations may be taken without removing the eye from the telescope; also, in an appliance employed in taking equal altitudes, to indicate the portion of the tangent screw previously used.

The inventor says: I *claim*, first, the combination of a spring click and micrometer wheel with the tangent screw of a sextant, substantially as and for the purpose set forth.

Second. The combination, with the tangent screw of a sextant, of the stop nut *I*, for the purpose explained.

No. 27,892.—THOMAS B. DE FOREST, of New York, N. Y., assignor to himself and WALLACE & SONS, of Ansonia, Conn.—*Improvement in Lanterns*.—Patent dated April 17, 1860.—This invention consists in a method of securing to the lamp of a lantern the springs that serve to hold said lamp in place in the lantern, and is designed to avoid the use of solder for the same purpose and also of rivets.

Claim.—The combination of the fastening springs *S* and the encircling band *B* with the lamp of a lantern, when said lamp and encircling band, or either of them, have depressions, or their equivalents, formed in their surfaces, substantially as described and for the purposes specified.

No. 27,893.—DAVID DONALDS, of New York, N. Y.—*Improved Machine for Cutting Veneers*.—Patent dated April 17, 1860.—This invention consists in combining a laterally sliding knife stock with a toothed segmental arm and a sliding rack on trunnions, in such a manner that the centre of the knife coincides with the centre of the trunnions, and that the inclination of the knife can be adjusted at any moment, as well when the same is in operation as when it is at rest. It also consists in arranging a reciprocating log carrier attached to vibrating arms in combination with laterally adjustable guide grooves, in such a manner that a curvilinear motion is imparted to the log carrier, which motion can be adjusted according to the nature of the stuff by means of the guide grooves.

The inventor says: I *claim*, first, combining with a laterally sliding knife stock *C* a toothed segmental arm *I* and a toothed sliding rack *J*, substantially in the manner and for the purpose described.

Second. The arrangement of laterally adjustable guide grooves *i*, and vibrating arms *S*, in combination with the reciprocating log carrier *L*, constructed and operating substantially as and for the purpose set forth.

No. 27,894.—STEPHEN PAYNE DUNHAM and AUSTIN HIPPLE, of Kilbourne, Ohio.—*Improved Churn*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the nollows *c* of the side pieces of the outer dasher, with the webs *a*, attached to the inner wall of the vessel *A*¹, together with the combinations of the hollows *a* of the side pieces of the inner dasher, with the webs *b* attached to the side pieces of the outer dasher, when these combinations are made and arranged, as and for the purposes specified.

No. 27,895.—LOVETT EAMES, of Kalamazoo, Mich.—*Improved Mortising Machine*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, giving a forward and reverse movement to the chisel and auger by cam *G*¹, when the same receives its motion from the main shaft *B*, and a drum *S*, through the medium of friction wheel *N*, on a counter shaft, having one end under the control of the operator, so that said wheel may be forcibly brought into contact with either the drum or shaft, by a rocking movement of the foot lever, at the option of the attendant, essentially as described and represented.

Second. I *claim* giving a simultaneous reciprocating movement to belt wheel *C*, to that of the auger and chisel stock *E D*, by means of the duplicate cam *G*², bar *L*, and yoke *h*, or their equivalents, for the purposes and substantially as set forth.

No. 27,896.—WILLIAM M. ELLIS and JONAS B. ELLIS, of Washington, D. C.—*Improvement in Casting Fire Plugs*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Preventing the heat of the molten metal from injuring the brass or other metal, which is to form the lining or seat surface for the plug or valve, by the use of the block *d*, or its equivalent, as set forth.

No. 27,897.—JAMES R. ENDER, of Trenton, La.—*Improvement in Hats.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A hat provided with a lining of lampblack, charcoal, or other equivalent non-conducting substance, as shown and described.

No. 27,898.—ISAAC P. FRINK, of Newark, N. J.—*Improved Reflector for Gas Lights.*—Patent dated April 17, 1860.—A shows the body of the reflector made of tinned sheet iron, lined on the inside with corrugated glass; a cover B is attached to the reflector at a certain distance over the opening *a*; the body of the reflector is provided with beads *b b*¹, near to its edges, and extending all round; the object of these beads is to catch those rays which would otherwise escape without any useful effect over the edges of the reflector.

Claim.—The arrangement of a rectangular pyramidal reflector A, with beads *b b*¹, near the upper and lower edges, in combination with a curved cover B and with a hinged adjustable section C, constructed and operating substantially in the manner and for the purpose specified.

No. 27,899.—F. F. FOWLER, of Crane Township, Ohio.—*Improvement in Elevators for Hay, &c.*—Patent dated April 17, 1860.—This invention has for its object elevating hay on the stack in forming the stack, and consists in having a platform which may be placed on wheels, or runners, if desired to convey it from place to place.

Claim.—The revolving cross bar D, constructed as described, with its adjustable arms *a*, and pulleys P, in combination with shaft S, platform A, fork F, ropes *c* and *c*¹, and pulley P¹, operating substantially as and for the purpose set forth.

No. 27,900.—THEODORE GRUNDMANN, of Freeport, Ill.—*Improvement in Machines for Crushing Sugar Cane.*—Patent dated April 17, 1860.—This invention consists in the employment of a large central cylinder, in connection with a series of pressure cylinders, for the purpose of crushing cane.

Claim.—The arrangement and combination for the purpose specified of the drum or cylinder D, pressure rollers E, provided with the feed and discharge spouts G H, and the receiver I, substantially as set forth.

No. 27,901.—MARTIN HALLENBECK, of Albany, N. Y.—*Improvement in Harvesting Machines.*—Patent dated April 17, 1860.—This invention consists of a bent, or crank shaped axle, arranged to vibrate so as to release and connect the gearing that operates the cutting apparatus.

The inventor says: I *claim* the arrangement of the bent or crank shaped axle C¹, to vibrate substantially as described, to release and connect the gearing, as described.

I claim the construction and arrangement of the tongue and main frame, in combination with the shank of the finger bar, hinged to the finger bar and main frame, in the manner and for the purpose specified.

No. 27,902.—JAMES HARE, JR., of Paterson, N. J.—*Improved Oil Cock.*—Patent dated April 17, 1860.—The plug A passes through globe B, and is fitted into the two seats *a* and *b*, one above and the other below the globe. Secured to the upper part of the plug is the cup C and handle D; an annular passage *c* leads from a cup to a recess *c*¹ in the seat *a*, so that, by turning the plug the opening of the passage *c* is brought opposite to the recess *c*¹, the oil from the cup C is allowed to enter into the globe B.

Claim.—The arrangement of the nut D¹, in combination with the movable plug A, and with the stationary globe B, constructed and operating substantially as and for the purpose specified.

No. 27,903.—GEORGE W. L. HAZEN, of Indianapolis, Ind.—*Improvement in Sugar Mills.*—Patent dated April 17, 1860.—The hoops or bands E hold the frame H and I, the heads G fitting firmly in the grooves J. The bands E are driven upon the swell, or enlarged part of the frame, which causes the heads to be firmly held in the same manner that the staves hold the heads of a barrel by the tightening of the hoops.

Claim.—The frame H I and G, when constructed and held in place by the hoops or bands E E, or their equivalents, substantially in the manner and for the purposes set forth.

No. 27,904.—L. HERMANCÉ, of Saratoga Springs, N. Y.—*Improved Beer Pitcher.*—Patent dated April 17, 1860.—This invention consists in arranging at the base of the spout of the

pitcher a valve, which is acted upon by a spring to keep it down tight when not in immediate use, for the purpose of preventing the contents from becoming "flat" or "dead," after long standing in the pitcher.

Claim.—The combination of valves C D, with a pitcher, when arranged in the manner and for the purpose described.

No. 27,905.—CORNELIUS HOOD, of Seneca Falls, N. Y.—*Improvement in Pumps.*—Patent dated April 17, 1860.—The following is the operation of this invention: As the plunger H rises it forces up all the water in the annular chamber above it, while the chamber below fills through the openings $f^1 f^1$ in the bottom. The inner cylinder G and interior of the plunger tube are filled through the valve b from the vacuum formed within them, the valve g being kept closed meanwhile by the pressure of water above it. As the plunger descends, the ring valve d rises and permits the water to pass from the lower to the upper portion of the outer cylinder, while the water in the interior cylinder and within the plunger tube is forced to rise through the valve g by the closing of the lower valve b .

Claim.—The arrangement and combination of the hollow piston H with the internal short cylinder G and external cylinder D, valves $g b$, and annular valve d , to form a continuous acting pump, substantially as and for the purposes set forth.

No. 27,906.—JAMES L. HOWARD, of Hartford, Conn.—*Improved Coupling Attachment for Cords, Ropes, &c.*—Patent dated April 17, 1860.—This invention consists in the use of a divided screw or corrugated or smooth conical tube, which embraces the end of the ropes, and also for attaching the same to any fixture.

Claim.—The employment of the tubes A, in combination with the rope or belt and the socket C, substantially as and for the purposes shown and described.

No. 27,907.—STEPHEN HUGHES, of Hamilton, Ohio.—*Improvement in Flour Separators.*—Patent dated April 17, 1860.—This improvement relates to a peculiarly formed helical beater, in connection with various devices for controlling and rendering more effective the feeding and separating operations.

The inventor says: I *claim*, first, the construction of the beater with shoulders E, and eccentric surfaces F, for the purposes set forth.

Second. The adjustable chute boards H, constructed and arranged, and operating in the manner and for the purposes set forth.

No. 27,908.—JAMES M. JAY and JOHN DANNER, of Canton, Ohio.—*Improved Egg Beater.*—Patent dated April 17, 1860.—This invention consists in combining with the egg beater, patented by J. M. JAY, February 7, 1860, a ventilating cap piece H, and an outer casing I.

Claim.—The combination of the beating device, represented by letters B C and D, in combination with the case I, substantially as and for the purposes set forth.

No. 27,909.—WILLIAM JEFFERS, of Pawtucket, R. I.—*Improvement in Pump Valves.*—Patent dated April 17, 1860.—As the stroke of the pump commences, the portion C of the valve opens first, but its opening is followed instantly by the opening of the portion B, and hence two passages are formed for the water, viz: The usual one between A and B, and another one between B and C, and by this means the pump is filled and discharged more freely, and is enabled to be worked with a less amount of power than when the ordinary valves are employed.

Claim.—The combination of the two valves B C with each other and with the seat A, and the hinges $a a$, as and for the purpose shown and described.

No. 27,910.—R. W. JENKS, JR., and F. A. STEERE, of Providence R. I.—*Improvement in Brakes for City Railroad Cars.*—Patent dated April 17, 1860.—This invention consists in the arrangement of an elliptic spring, in such a relation to the brakes that are made to operate upon a cylindrical drum wheel fixed to the axles, that by the combination of a clutch attachment and ratchet wheel the driver may apply the brakes at any moment to said drum, which will cause either axle of the car wheels to act against the spring and compress it, after which the spring will exert a powerful force to further retard the motion of the car by the friction of the brakes on the drum wheel alone.

The inventors say: We *claim*, the combination with spring G, working in a suitable slide box, of the pawl bar H, brake bar J, with its shoe K, the ratchet wheel D, and brake wheel E, and the sliding clutch arm M, with its pin g , passing through the shoe K, the whole arranged, operating, and operated by a lever N, substantially as and for the purposes set forth.

We further claim the lever c , arranged as set forth, and operated by the draft rod d , in conjunction with the brake bar J, for the purposes specified.

No. 27,911.—J. B. JONES, of Brooklyn, (E. D.,) New York.—*Improved Machine for Forming Vessels of Sheet Metal*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the employment of a blank holder D, or its equivalent, arranged in such a relation to the die or counter die, and operated in conjunction therewith, that the blank of which the pan is to be formed will be held down on the counter die and prevented from crimping while the die is carrying the blank down, essentially in the manner and for the purpose set forth.

Second. I claim the clutch M, arranged and combined with the die screw shaft H, in combination with clutch plate G of shaft J¹ and gauge screws *e e e*, for the purpose of causing the die and die holder to descend together until the former comes in contact with the blank on the counter die, when the die will descend alone the required distance.

No. 27,912.—HENRY JOHNSON, of Washington, D. C.—*Improvement in Vapor Lamps*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the pipe B, when used as a fluid pipe and generator or vaporizer, and also when used as a gas pipe, in connection with nib C, for the conveyance of fluid from the supply pipe for generating or vaporizing, and for conveyance of gas or vapor to the burner.

Second. The combination of two regulating set screws or keys G and F, operating substantially as set forth and for the purposes described.

No. 27,913.—BENJAMIN I. LANE, of South Framingham, Mass.—*Improvement in Shoemaker's Awls*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of the projection or shoulder *c*, nut *b*, and slotted screw cone *a*, substantially as described, whereby the projection of shoulder *c* is made to perform the function of driving the pegs, and also serve as a means to facilitate the screwing up of the nut, and consequently the securing of the awl to the handle, substantially as described.

No. 27,914.—DANIEL LEE, of Boston, Mass.—*Improved Steam Trap*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* my improved steam trap expander, as made tubular or hollow, and with one or more lateral openings *e*.

I also claim my improved mode of arranging or combining the tubular expander with its valve and case, viz: by having the expander at or near one end of it fastened to and opening through one end of the case, while its other end is connected with the valve C.

I also claim making the valve C separate from the expander, and applying the two together by adjusting screws B C as described.

No. 27,915.—CHARLES L. LIERNUR, of Mobile, Ala.—*Improvement in Testing the Wear of Railway Rails and Wheels*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A railroad car revolving by means of a centre shaft, and supported by 4, 8, or more wheels, the axles of all of which point towards said shaft, and running said car upon a circular track of railroad rails, for the purpose of submitting both rails and wheels to a test of actual usage, substantially as and for the reasons described.

No. 27,916.—LOOMIS MANN, of Ionia, Mich.—*Improved Machine for Making Eave Troughs*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the wing or bed piece B, and clamping plate C, rigidly attached to roller H, forming a lever thereto, operating in combination with the movable bar D, in the manner and for the purposes set forth.

Second. I claim notching the edges of bar D and clamping plate C, where they cross the lap of the plates to admit of their being soldered from edge to edge whilst in the machine, substantially as specified.

No. 27,917.—T. H. McCULLOCH, of Peoria, Ill.—*Improvement in Grain Drying Machines*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the tubes C, conical chamber D, and hollow plugged shaft B, placed within a rotating slightly inclined cylinder or shell A, and arranged to form steam or hot air passages *g E h* to heat the chamber D and tubes C, substantially as and for the purpose set forth.

I further claim the arrangement of the plate *i*, connecting two tubes C to form a water-lifting chamber *j*, and the tube *l*, to form a communication between said chamber *j* and the shaft B, as and for the purpose specified.

No. 27,918.—W. S. McEWEN and N. A. PATTERSON, of Kingston, Tenn.—*Improvement in Overshoes, and Boots and Shoes.*—Patent dated April 17, 1860.—The object of this invention is to promote a free circulation of air on the inside of shoes or overshoes for keeping up a circulation of the blood in the extremities by carrying off the perspiration from the feet.

Claim.—A tube C formed around the edge of the mouth of a shoe having a corrugated inside surface, the corrugations communicating with said tube, substantially as and for the purposes set forth.

No. 27,919.—J. H. McGEHEE, of Athens, Ala.—*Improvement in Grain Separators.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, arranging a pivotted self-adjusting float or board across the lower end of the second sieve, so that the wheat, in passing off of said sieve, shall be evenly spread, before it enters the separating flue, and in case the feed be rapid, the escape shall be commensurate therewith, substantially as and for the purposes set forth.

Second. Bevelling the slats of the flue from their inner edge to within about one-third of their rear edge, and hanging them out of centre on pivots, substantially as and for the purposes set forth.

No. 27,920.—J. VAUGHAN MERRICK, of Philadelphia, Pa.—*Improvement in Steam Carriages.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the use of a surface condenser immersed in water, when the water used for such surface condenser is cooled, or partially cooled, by the passage of currents of air, in the manner set forth.

Second. The combination of the boiler and engines with surface condenser and cooling apparatus, when constructed, arranged and operated substantially as described, for the purpose of propelling carriages by steam, substantially as set forth.

No. 27,921.—AZEL REYNOLDS, JR., of North Bridgewater, Mass.—*Improved Staging Supporter for Mechanics' Use.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* so arranging the two sets of struts of the staging supporter, that one set may directly bear or sustain the sliding bracket while the other supports the post, as described.

I also claim arranging the two brackets and posts, and combining them together, substantially as represented in Fig. 4, and as described.

I also claim combining with each post an adjustable socket, carrying ear pieces or bearers for the reception of the struts, as described.

I also claim combining a lateral rest *b* with each bracket, the same being to support the bracket laterally against a wall or another such rest.

No. 27,922.—JAMES MONTGOMERY, of Baltimore, Md.—*Improvement in Steam Boilers.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Combining with a boiler which has a series of horizontal flues or tubes, or a boiler of any form other than that specified in my above-mentioned letters patent, but which has the flue space or passage leading from the fire chamber to the tubes or flues at one end of the said chamber, a grate of the whole or nearly the whole length of the boiler, with one or more fire doors at each end, substantially as and for the purpose set forth.

No. 27,923.—JAMES MOORE and ARCHIBALD KELLY, of Pittsburgh, Pa.—*Improved Machine for Making Picket Fence.*—Patent dated April 17, 1860.—This invention consists in a mechanical arrangement of twistors, guides, carriage reels, and take up; the whole arranged for the purpose of forming a machine for making picket fence.

The inventors say: We *claim*, first, the arrangement of the wheels 31 and *u*, cam *m*, cam yoke *n*, operating and regulating stops *j*, section of wheel *q*, and wheels *r s* and *t*, in combination with the reels *v*, springs *w*, and twistors *l*, as described, and for the purposes set forth.

Second. The use of the carriage *b*, when used in combination with the twistors *l*, reels *v*, and cam wheel *A*, as described and set forth.

Third. The use of guides *H*, when used in connection with the carriages *b* and ways *11*, as described, and for the purpose set forth.

Fourth. The combination of the take up reel *B*, ratchet wheel *C*, ratchet pawl *D*, and frame *c*, when arranged, constructed and operated in the manner specified, for the purpose set forth.

No. 27,924.—PHILEMON A. MORLEY, of Brooklyn, N. Y.—*Improvement in Lanterns.*—Patent dated April 17, 1860.—The inventor says: I form the top of my lantern in one piece,

seen at S, and separate the lower sections or sides from each other, and from either the bottom or top, or from both at the same time by means of an adjustable joint or hinge.

Claim.—The arrangement of the sides $N N^1 N^2 N^3$, loops $a a^1 a^2 a^3$, and rods $b b b b$, in relation to the top and bottom of a lantern, in the manner and for the purpose specified, and shown in the accompanying drawings.

No. 27,925.—MILO PECK, of New Haven, Conn.—*Improvement in Atmospheric Hammers.* Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Interposing a wooden planking or other non-conducting material between the frame which supports the mechanism of a trip hammer, and the bedpiece which forms the common foundation of the frame and the anvil, substantially as described, for the purposes specified.

No. 27,926.—JONAS PERKINS, of Braintree, Mass., assignor to N. S. C. PERKINS, of Norwalk, Ohio.—*Improvement in the Driving Mechanism of Sewing Machines.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The method, substantially as described, of communicating power to sewing machines by means of self-locking and unlocking clutches or wheels, arranged, the one to drive the other in one direction only, when said clutches are hung for independent and joint rotation on separate shaft or distinct axle bearings—the one of which is attached to a lifting or opening and closing portion of the machine, and the other disconnected therefrom, for the double purpose of preventing the machine from being improperly driven backwards, and to facilitate the exposure of the underworks; also whereby the machine, when driven by a band or belt, may be opened without unshipping the band.

No. 27,927.—JEHU MITCHELL, of Aleppo Township, Pa.—*Improved Churn.*—Patent dated April 17, 1860.—In front of the standard D one half of a vertical journal box is formed; the other half or cap G is hinged at one side in such a manner as to permit the ready removal of the shaft suspended and working therein, by unhooking and swinging open the cap of the box. H is a hook, and I a pin or eye attached to the standard and cap respectively for the purpose of keeping the latter closed. J is the dasher shaft extending nearly to the bottom of the tub, having upon it two collars K L, one beneath the pinion M, and resting on the top of the box, and the other just below the bottom of the cover to prevent the vertical motion of the dasher shaft, and also to prevent the cream from being thrown upon the journal bearing of the shaft J.

Claim.—The arrangement of the gearing E M, standard D, hinged cap G, vertical dasher J N, and collar L; the whole being constructed and combined in the manner and for the purposes before set forth.

No. 27,928.—E. B. REQUA, of Jersey City, N. J.—*Improvement in Horse Powers.*—Patent dated April 17, 1860.—This invention consists in a certain arrangement of chain wheels, cog wheels, and grooved rollers, in combination with one or more loose rims of a peculiar form, and with an endless apron running over a roller platform in such a manner that a horse travelling on said endless apron imparts a rotary motion to the rims, which, when applied to a railroad car, take the place of the driving wheels, or when intended to drive other machinery one of said rims takes the place of the driving pulley.

Claim.—The arrangement of the hollow rims I, in combination with the toothed rims H, cog wheels G, chains c, chain wheels E and E¹, and endless apron A, constructed and operating substantially as and for the purpose specified.

No. 27,929.—JOHN ROBINSON of Eli, of Sharptown, Md.—*Improvement in Seed Planters.* Patent dated April 17, 1860.—This invention consists in certain improvements in seed planters. On the front side of the cross bar g is located a clutch rod o, secured at one end to the face of said bar, so that its other end has a continual tendency to spring from it, while the other is connected with a wire s passing immediately beneath the right hand operator's handle G, and connected with a trigger or finger lever N.

Claim.—The combination of the clutch rod o and wires s with trigger N at the handle G, the whole arranged and operating in connection with the adjustable indicating wheel and dropping devices, substantially as described.

No. 27,930.—ROBERT E. ROGERS, of Philadelphia, Pa.—*Improvement in Steam Generators.* Patent dated April 17, 1860.

The inventor says: The boiler sheet I make of thin metal, because it is not intended that it shall bear or resist any pressure, but that the rings alone shall withstand it. To unite the edges or form the seams I either weld or braze them when copper is used, or employ small rivets, which are hammered flat and even with the boiler sheet. The metallic rings I construct of broad bar iron.

Claim.—Constructing steam generators or boilers of the rings, as set forth, either alone or in combination with the interior sheet, substantially as described.

No. 27,931.—HENRY S. ROOT and THOMAS LLOYD, of Muncy, Pa.—*Improvement in Straw Cutters.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the combination of a vibrating box with a stationary knife, when the whole is arranged so as to cause the weight of the box and its contents to assist in producing the cut, as hereinbefore described.

We also claim the combination of the vibrating racks P and Q with the gears *o* and *p*, or their equivalents, substantially as hereinbefore described, for the purpose of feeding the material intermittently, as hereinbefore specified, for the purpose set forth.

No. 27,932.—JEFFERSON SHORT, of Leavenworth, Kansas.—*Improvement in Machines for Crushing Quartz.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the application and combination and arrangement of a series of crushing wheels combined with balance wheels or dead weights, so arranged on endless track that motion will be uniform on said track, as described in Fig. 2 of drawing, by means of coupling the ends of shafts together, and revolving cylinder with boxes in which axis of shafts revolve at centre, one independent of the other.

And I further claim the invention of the double revolving cylinder, which revolves independent of upright shaft and driving wheel.

I do not claim the invention of the wheels, but the arrangement and combination of the same, as described in specification and drawings.

No. 27,933.—HORACE SMITH and DANIEL B. WESSON, of Springfield, Mass.—*Improvement in Filling Metallic Cartridges.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A cartridge in which fulminate is contained in the hollow, annular, projecting base, substantially as described, without being previously inclosed in a hollow metallic ring.

No. 27,934.—WILLIAM STEINMETZ, of Philadelphia, Pa.—*Improvement in Eyelet Machines.* Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Giving a sharp, angled, pointed shape to the extremity of the shank *d* of the punch of my improved eyelet machine, when the said punch is otherwise of the shape represented in the accompanying drawings, and when it is used in connection with a perforated die plate, substantially in the manner and for the purpose set forth.

No. 27,935.—JOHN TANEY, of Austin, Texas.—*Improvement in Apparatus for Boring Artesian Wells.*—Patent dated April 17, 1860.—This invention consists in combining pump valves and pistons with a drill for boring artesian and other wells, in such a manner that the usual way of lifting the drill and letting it fall will also be the means to admit clean water to the drill, and pump up the water mixed with the products of the boring operation.

Claim.—Combining with the tubes B and E *i i*, which are provided with arms H H and H² and with dovetail grooves in their surfaces, valves U R and D, valve piston F² and solid piston F, in the manner and for the purposes specified.

No. 27,936.—WILLIAM THOMSON, of Detroit, Mich.—*Improved Forge Bellows.*—Patent dated April 17, 1860.—This invention consists in the employment of a cylinder having two compartments in each end, connecting with the interior of the cylinder by valvular openings, and with the outer air at one end, the forge at the other; said cylinder to be partially divided longitudinally by an air tight diaphragm and to be partially filled with water, so that by giving to the cylinder a vibrating or rocking motion air will alternately be drawn into the cylinder on each side of the diaphragm from one end and forced out at the other end.

Claim.—The arrangement in cylinder A of partitions F F¹, with their valves H H¹ and I I¹, and central partition J, when the same are combined and a blast of air is obtained, substantially in the manner and for the purpose described.

No. 27,937.—JAMES S. TRIPP, of Danby, N. Y.—*Improved Saw Filer.*—Patent dated April 17, 1860.

The inventor says: The mode of operating this saw filer is to make fast the saw in the jaws; then commence with the right hand tooth and file it; as soon as one tooth is done put

the click on it, and adjust the click and file by means of the set screw M, and regulate the depth of filing by the cam and gauge, and bevel of the teeth by the pin and holes.

Claim.—The specific device described for bevelling the tooth of the saw, namely: the angle I, the projections O O, and the pin K, attached and operated as described.

No. 27,938.—W. C. TURNBULL, of Baltimore, Md.—*Improvement in Compressed Air Engines.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application to compressed air engines of an expansion cut-off, which is operated by a positive motion, but the stroke of which is regulated automatically by the pressure of the air in the holder or reservoir, so as to admit a volume of air of a certain density directly to, and allow it to expand in, the cylinder, for each stroke of the piston, as is necessary to drive the engine at a certain speed, substantially in the manner described.

No. 27,939.—PETER L. WEIMER, of Lebanon, Pa.—*Improved Mode of Actuating Governor Valves of Steam Engines.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the movable rockshaft I, operated in the manner set forth, by means of the levers F attached to the governor spindle D and sliding boxes H, as described and specified.

I also claim actuating the rockshaft I by means of an eccentric on the engine shaft, when used in combination with the sliding boxes H and levers F attached to the governor spindle D, as described and specified.

I also claim the rods O working through the plate P, with the jam nuts R, India rubber buffer S, and spiral spring U, with the adjusting jam nuts Q, in combination with the arm N on the valve rod L, for the purpose as herein more fully described and specified.

No. 27,940.—ISAAC P. WENDELL, of Philadelphia, Pa.—*Improvement in Journal Boxes.*—Patent dated April 17, 1860.—This invention relates to improvements in journal boxes, which are furnished at one or both ends with a chamber containing packing to prevent the lubricating material from escaping from the oil chamber of the box. It consists in the employment of a double washer, forming the packing, a wedge formed strap bolt, a follower, and a bent strip.

The inventor says: I *claim*, first, the double washer E, of leather or other suitable material, the wedge formed strap bolt G, and the follower H, the whole being arranged within the chamber D of a journal box, substantially in the manner and for the purpose set forth.

Second. The follower H, and the bent strip F, in combination with the packing E, and the strap bolt G, the whole being applied to the journal box in the manner and for the purpose specified.

No. 27,941.—GEORGE WESTINGHOUSE, of Schenectady, N. Y.—*Improvement in Grain Separators.*—Patent dated April 17, 1860.—This invention consists in the arrangement of two carriers or screens connected with the thresher, whereby the parts are adjusted or set in working motion.

Claim.—The combination of the carriers D and E, the carrier D resting on the inner end of carrier E, whether the carriers are suspended from the thresher frame or otherwise, operating as described, for the purpose set forth.

No. 27,942.—CHARLES K. WILLIAMS, of Haddonfield, N. J.—*Improved Washing Machine.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the arrangement of the adjustable dividing board I with the levers J J, the board being so secured as to slide up and down between guides attached to the levers, substantially as and for the purpose set forth.

Second. The arrangement with the shaft D, of the springs *a a*, made to operate upon different sides of said shaft, and the weights *d d*, when the same are used as and for the purpose set forth.

No. 27,943.—HIRAM ABBOTT, of Wakeman, Ohio, assignor to himself and L. A. LYON, of said Wakeman.—*Improvement in Heading Bolts.*—Patent dated April 17, 1860.—This invention consists in the use of the T shaped die jaws for clamping the rod to be headed, and also in the construction and operation of the follower *a b* for forming the head on the rod.

Claim.—The adjustable jaws B, the header and follower *a b*, and the guides D, operating as described and for the purposes set forth.

No. 27,944.—WILLIAM W. ALLEN and JAMES MOLYNEUX, of Bordentown, N. J., assignor to themselves and JOHN L. McKNIGHT, of said Bordentown.—*Improvement in Sewing Ma-*

chines.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a circle with teeth on its periphery to feed the cloth or material being sewed, when said circle is arranged to turn on a stationary ring through which the needle may be threaded, whether said circle is arranged above or below the cloth.

No. 27,945.—HENRY BELFIELD, of Philadelphia, Pa., assignor to himself and SAMUEL W. HOFFMAN, of said Philadelphia.—*Improvement in Pumps.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The shaft D, its two cranks d and d^1 , in combination with the rods G and G^1 , and valved buckets I and I^1 , and their valves A and A^1 ; the whole of the parts being constructed and arranged as set forth, so that a simultaneous reciprocating motion, in contrary directions, may be imparted to the said buckets by the rotation of said shaft D, and so that the two barrels may be in a direct line with each other.

No. 27,946.—JAMES BLAKE, of East Pepperell, Mass., assignor to himself and HENRY BLAKE, of said East Pepperell.—*Improved Auger.*—Patent dated April 17, 1860.—This invention consists in forming on the end of the auger shank an enlarged cylindrical portion, having a suitable screw thread cut on it and a short spiral groove terminating in a radial cutting point on the end of the auger, and a conical screw point which serves to centre and start the auger, while the cutter on the end of the cylindrical screw portion serves to cut a hole corresponding in diameter to the enlargement; through this enlargement passes an adjustable cutter which immediately succeeds the screw on the enlargement, and forms a hole in size according to the distance the cutting is set from the axis of motion.

Claim.—The combination, with extensible cutter bar G, of the screw enlargement C, with or without the centre point D; the same being arranged as and for the purposes set forth.

No. 27,947.—JOSEPH W. BRIGGS, of Cleveland, Ohio, assignor to himself and JACOB W. JORALEMON, of said Cleveland.—*Improvement in Window Sash Supporters.*—Patent dated April 17, 1860.—This invention consists in the construction of a combined lock and sash balance, which in its application to the window frame is attended with but little expense and trouble.

Claim.—The combination, construction, and arrangement of the double acting spring bolt C, with the frame A, drum B, coiled spring F, leather strap R, and friction roller S, substantially as described, for the purposes set forth.

No. 27,948.—CHRISTOPHER G. CROSS, of Chicago, Ill., assignor to himself and G. H. BAILEY, of said Chicago.—*Improvement in Tension Apparatus for Sewing Machines.*—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with a friction apparatus for producing tension on the thread, of a lever D, through or in contact with which the thread passes, in such a manner that any tendency to irregularity in the friction is counteracted by the consequent irregularity of the draft of the thread upon the said lever, substantially as described.

No. 27,949.—LUZON C. ENGLISH, of Canton, N. Y., assignor to himself and GALUSHA M. ANGIER, of Washington, D. C.—*Improvement in Stump Extractors.*—Patent dated April 17, 1860.—This invention consists of a peculiar arrangement of the gears in connection with movable legs of a peculiar construction, and provided with adjustable rollers.

The inventor says: I *claim*, first, the described stump extractor, provided with two sets of gearing, consisting of shafts L M, with their spur wheels, cog wheels, and clutches; all arranged and operated, substantially as set forth, for the purposes described.

Second. I claim the use of the wheels S and U, in combination with the double gears above claimed, substantially as described, for the purposes specified.

Third. I claim the adjustable wheels E, in combination with the foot pieces D, substantially as described.

No. 27,950.—D. G. FLETCHER, of Racine, Wis., assignor to himself and JAMES YATES, of said Racine.—*Improvement in Heat Radiators.*—Patent dated April 17, 1860.—This invention is an improvement in radiators through which the smoke and heated air ascending from a furnace or ordinary stove, situated in the lower story of a building, is to be conducted for economizing fuel by abstracting the heat from the products of combustion in their upper passage and radiating it into the room.

Claim.—The arrangement and combination, as shown and described, of the perforated conical cylinder C, registers F G, air space E, within the drum A, for the purpose specified

No. 27,951.—E. F. M. FLETCHER, of Georgia Plains, Vt., assignor to himself and JAMES M. EDNEY, of New York, N. Y.—*Improvement in Wind Mills*.—Patent dated April 17, 1860. This invention consists in the employment of a deflecting cone placed over the gearings, and so arranged relatively to the wheel that it may serve as a vane and keep the former facing the wind, the cone serving the tripple purpose of vane cover to the gearing and deflector, to cause the wind to act in the most effective manner against the wind wheel.

Claim.—The employment or use of the cone L, applied to the revolving cap C, and placed relatively with the wind wheel H, and gearing E F, to operate as and for the purpose set forth.

No. 27,952.—JOSEPH KOEHLER, of New York, N. Y., assignor to himself and HEINRICH SOLTMAN, of said New York.—*Improved Head Gear for Stopping Runaway Horses*.—Patent dated April 17, 1860.—This invention consists in a means for blinding the horse by pulling on a check rein, so that by covering his eyes he will be unable to see and stop. Should the operation of the blinders not be sufficient to check the horse, an additional pull on the same check rein brings the compressing operation on each side of the nostrils and obstructs the admission of air and overpowers the animal.

Claim.—The combination of the blinders g, compression pads o, sliding rod n, and inclines with the check rein h m, and collar i, substantially as set forth.

No. 27,953.—GEORGE MUNGER, of New Haven, Conn., assignor to himself and E. P. DEAN, of said New Haven.—*Improved Machine for Polishing Wood*.—Patent dated April 17, 1860.—This invention consists in arranging in a suitable relation with a system of feeding pressure rollers, a number of rotary disks which are placed in a horizontal plane and have roughened surfaces suitable for smoothing work passed over or in contact with their faces.

Claim.—Combining with suitable rotating smoothing disks, adjustable or self-adjusting feed and pressure rollers, for the purposes, and essentially in the manner, set forth.

No. 27,954.—EDMUND W. TARBELL, of Boston, Mass., assignor to himself and EDWIN SIMONDS, of said Boston.—*Improved Steam Boiler*.—Patent dated April 17, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination and arrangement of the water and steam space a, the transverse water space b, and the series of bent connection tubes c c, the furnace d, the smoke or heat chamber e, and the connection tube or tubes f, the whole forming an upright boiler or steam generator.

No. 27,955.—JOSEPH P. WOOD, of Troy, Ohio, assignor to himself and A. JOHNSON, of Parkham, Ohio.—*Improved Coopers' Tool*.—Patent dated April 17, 1860.—This invention relates to the formation of a tool by means of which the circumference of a barrel head may be cut and bevelled to the proper size and thickness for the chime, so that by shaving away the superfluous wood upon the underside the head will be completed and ready for use.

Claim.—The described barrel head parer, consisting of the stock A, bit B, tooth C, slider E, and thumb screw F, when the several parts, or their equivalents, are constructed and arranged as specified, and operating in the manner and for the purpose set forth.

No. 27,956.—GEORGE C. AIKEN, of Nashua, N. H.—*Improvement in Cultivator Teeth*.—Patent dated April 24, 1860.—The lower part a of the socket piece E is hollowed out on the under side so as to fit on the shoulder B¹, while the part b rests on the plate B. The upper part e of the coulter A slides into a dovetailed groove on the underside of the plate B; the front part e¹ being widest, the coulter A is held firm and secure; the harder it is forced back the tighter it fits.

Claim.—The combination and arrangement of the socket E, shoulder B¹, and journal B², with the plate B, vertical coulter A, flanges or mould boards C C, and cutters D D, substantially as set forth.

No. 27,957.—DANIEL BARCLAY, of Chicago, Ill.—*Improvement in Show Case Doors*.—Patent dated April 24, 1860.—This invention consists in making a groove around the back part of a show case frame, wide enough to allow one door to pass another. Each door is supplied with a spring of sufficient power to keep it in its place when shut.

Claim.—The described construction of groove, spring, and box, the whole being arranged, combined, and operating in the manner and for the purpose specified.

No. 27,958.—JOHN BARNES, of Lima, N. Y.—*Improvement in Broadcast Seeding Machines*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method described of sowing broadcast, by combining with a wagon or draught vehicle, carrying a seed box or hopper, a seed circulating and distributing apparatus, constructed to carry or pass the seed from the hopper to and beyond

either side of the vehicle, along extended hollow arms or conduits perforated to distribute or let the seed drop as it is circulated, in a current or currents, along the hollow arms or conduits, and the circulation kept up by establishing a vent or return current for the surplus seed, substantially as specified.

Second. The combination and arrangement substantially as specified, for action outside of, but in concert with, a feeding reservoir or hopper, carried by a draught vehicle, of extended and perforated seed distributing arms, or conduits, made capable of projection laterally beyond either side of the hopper and vehicle, or track of the latter, and when not required to sow, of adjustment to within the width of the vehicle, or thereabouts, surplus seed return pipes or conduits, and a conveyor, or conveyors, operating to circulate the seed through the distributing arms and return pipes, and pass it for distribution outside of and beyond both sides of the vehicle simultaneously.

Third. The combination with the hopper, discharge valves or slides *c* of the valves or slides *b*, to the distributing arms, arranged to operate together and in unison, essentially as shown and described.

Fourth. The combination with the surplus seed pipes, or conduits, of a sieve or sieves, operating to sift the seed as it is returned from the distributing arms or conduits, essentially as set forth.

No. 27,959.—LOUIS D. BARRAUD, of New York, N. Y.—*Improved Paper Bag Cutter*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved tool, or improved article of manufacture, a paper bag cutter, composed of a gauge table A, fixed angular knife B¹, angular hinged shear knife B, and otherwise constructed as shown and described.

No. 27,960.—LEVI A. BEARDSLEY, of South Edmeston, N. Y.—*Improved Bench Vise*.—Patent dated April 24, 1860.—The jaws A A are strongly pivoted to two arms B, which themselves are pivoted together at their lower ends at *a*; these parts are made of suitable metal, and work freely in their joints. D is a right and left screw shaft topped through each jaw, and having a suitable handle for turning the screw in opening or closing the jaws.

Claim.—The arrangement and combination of the pivoted jaws A, hinged arms B, guide bar E, recess *c*, right and left screw D, and ring *b*, as and for the purpose shown and described.

No. 27,961.—MARTIN A. BELL, of Rushford, N. Y.—*Improvement in the Method of Tanning*.—Patent dated April 24, 1860.—The claim explains the nature of this invention.

The inventor says: I *claim* combining lye with tannic acids, whereby I am enabled to prevent the tanning liquors from becoming decomposed or sour, am enabled to strengthen them without accumulating more than necessary, and can tan skins in shorter time and with less labor than by any other known process.

No. 27,962.—G. T. BENNETT, of Mount Olive, N. C.—*Improvement in Corn and Cotton Cultivators*.—Patent dated April 24, 1860.—This invention consists in the combination and arrangement of the different parts.

Claim.—The curved beam B as constructed, in combination with the straight beam A, side beam *c*, braces *d* and *e*, side and double turn ploughs F and G, and cotton scraper D, the whole being arranged in relation to each other substantially as and for the purpose set forth.

No. 27,963.—GOODWIN O. BISHOP, of Hannibal, Mo.—*Improvement in Truss Bridges*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of the shoe G, step U, and strap or stirrup H, for the purpose of connecting and securing the arch chord D to its bottom chord F, in the manner described.

Second. I claim the combination and arrangement of the chord F and arch chord D with the compound truss C, arranged as described, whereby the camber of the bridge may be adjusted at any and all points, and the counter braces sustained against the shock of a moving train or other heavy body passing over the bridge.

No. 27,964.—SYLVANUS F. BROOKS, of Weston, Mass.—*Improved Infants' Cradle*.—Patent dated April 24, 1860.—This invention consists in constructing and ornamenting the body and rockers of a cradle, so that it may be used by a simple change for a settee, combining with the same a suitable cushion which will serve as a bed when the article is used for a cradle.

Claim.—The combined settee and cradle, constructed in the manner set forth; as a new article of manufacture.

No. 27,965.—SYLVANUS F. BROOKS, of Weston, Mass.—*Improved Looking Glass or Mirror*.—Patent dated April 24, 1860.—This invention consists in combining with a looking glass and frame a draw, which is to be hung within said frame by weights or other equivalent substitute, in such a manner that the draw may be opened and remain in its open state by the weights alone.

Claim.—The described and represented combination of a toilet draw with a looking glass frame, as a new article of manufacture.

No. 27,966.—LYMAN BROWN, JAMES LELAND, and JOHN LELAND, of Worcester, Mass.—*Improvement in Car Axles*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the quill box or bearing *c c*, accomplishing the double purpose of connecting and securing the two parts of axle A and B, and making one of the two bearings as specified.

Second. We claim the recess I I, the bearings F and H, substantially as specified.

No. 27,967.—LEVI W. BUXTON, of Nashua, N. H.—*Improved Animal Trap*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* arranging the spear frame D, and its operating springs E E, on rods C C, extended from the bait platform carrier A, in combination with arranging the tripping lever H and the holding bar G on the said posts, and so as to operate with respect to the bait platform and the brail of the frame D, substantially as described.

I also claim the arrangement of the series of points or lances *c c*, &c., with respect to the bait platform B, viz: so as to surround it on opposite sides as described.

No. 27,968.—JOHN CADWELL, of Cincinnati, Ohio.—*Improved Carpenters' Clamp*.—Patent dated April 24, 1860.—This invention consists in the employment of a windlass, rack and pinion, levers, stops, and an adjustable jaw, arranged and operating together for the purpose of clamping together and securely retaining the parts of doors, sashes, blinds, and other small frame work, while the same are bored and pinned together or keyed in place.

The inventor says: I *claim*, first, the adjustable jaw A, windlass C, pinion *g*, rack *h*, and levers *j*, arranged and operated in combination with stops *m*, substantially as described and for the purpose set forth.

Second. I claim the stop *n*, the swinging piece *p* and shifting bar *q*, arranged as described and acting in combination with the windlass C, substantially as and for purpose set forth.

No. 27,969.—MERVIN R. CHACE, of Fall River, Mass.—*Improvement in Casting Molasses Gates*.—Patent dated April 24, 1860.—The principal object of this invention is to cast the body of a molasses gate with its conduit, or eduction tube formed with an angular bend *a*; *b* being the valve seat plate usually applied to the said conduit.

Claim.—The arrangement of the two sliding cores or mandrels, the valve seat and bent conduit matrices.

No. 27,970.—ELIZUR E. CLARK, of New Haven, Conn.—*Improvement in Concrete Walls*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a hollow concrete wall, made as described, by scoring out a space between the inner and outer portions, and connecting the parts with isolated binders, as described, the combination of the isolated binders with the parts of the wall, as shown, forming the necessary connection, while at the same time it does not interfere with the circulation, but allows both lateral and vertical circulation, except so far as the former is obstructed by the flues which pass upward through the wall, the whole being constructed and operating substantially as set forth.

Second. The combination, with a concrete wall made in two parts, as described, of binders which are non-conductors of moisture, substantially as described, for the purpose set forth.

No. 27,971.—ALFRED DAMARIN and GEORGE C. BROWER, of New Orleans, La.—*Improvement in the Construction of Instruments for Lighting Gas*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim*, first, the combination of the wax taper holder with the gas key.

Second. The bending of the taper holder, so as to light gas through the top of the gas globe.

Third. Placing a flame guard beyond the end of the taper pipe.

Fourth. Leaving an open space between the said guard and the end of the pipe, all substantially as described.

No. 27,972.—JOHN DECKELMANN and FREDERICK SPIESS, of New York, N. Y.—*Improved Fire Escape*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* the employment or use of a series of iron ladders C D E, arranged so as to fold together, all or a portion of them, and be extended as required, and also to swing out from the building, as and for the purpose set forth.

We also claim, in connection with the above, the folding balcony platforms *n*, for the purpose specified.

No. 27,973.—F. O. DEGENER, of New York, N. Y.—*Improvement in Printing Presses*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the combination of a rotating ink-distributing table, with a rotating reciprocating type bed, for the purpose as described.

Second. I claim the combination of the described mechanism for giving the desired movement to a type bed hinged to a platen; the said mechanism consisting of the revolving shaft H passing through the pieces or piece F, which support and guide the platen; the pieces or piece F, the alternately rotating reciprocating shaft *f*, supporting the type bed, the vibrating supports L, or their equivalents, the connecting piece E, or its equivalent; the connecting pieces M being attached to the shaft *f* of the type bed at one end, and connected at the other end by pins or bolts, set eccentrically to the shaft H, to wheels, plates, or arms attached to the shaft H.

Third. I claim, in combination with a type bed constructed and operating as described, the eccentric P, for the purpose of adjusting and varying the linear position of the type bed and platen.

Fourth. I claim the described construction of the card arrangement, operating as and for the purpose as set forth.

Fifth. I claim, in combination with the described card gauge and gripper, making the end gauge entirely separate from the side gauge, and attaching the end gauge to the platen on the side opposite to the side gauge and gripper, for the purpose as described.

Sixth. I claim attaching the frisket or gripper frame to a rotating reciprocating type bed, or to arms projecting from such type bed, in such a manner that the said frisket or gripper frame shall be carried by, and moved with, said type bed; and holding said gripper frame in the desired position when the grippers are not in contact with the platen, and allowing the gripper frame to assume the requisite positions when the grippers are in contact with the platen, and causing them to gripe and hold the paper against the platen, by and through the tension of a spring or springs only; thus dispensing with cams or stops generally used for such purposes.

Seventh. I claim, in combination with a type bed and platen, constructed and operating as described, the eccentric pin, bolt, or shaft, for the purpose of suspending the taking of an impression.

Eighth. I claim suspending the operation of the card drop motion during the suspension of the impression.

Ninth. I claim the combination of the eccentric pin, bolt, or shaft with a card drop motion, for the purpose of suspending the operation of such card drop motion.

Tenth. I claim suspending the taking of an impression, and suspending the operation of the card drop motion, by and through one and the same means.

Eleventh. I claim the combination of a type bed, operating as described, with the stationary ink roller supporters.

No. 27,974.—DARWIN ELLIS and PHILANDER HYNE, of Waterbury, Conn.—*Improved Portable Match Case*.—Patent dated April 24, 1860.—This invention consists of a metallic case within which the matches are retained; by a revolving motion each match is presented to an opening in the case, and delivered therefrom by the operation of a cross slide.

Claim.—The combination of the slotted case *a*, revolving shaft *b*, having the wings 3 3, and the cross slide and delivering finger 6, substantially as set forth.

No. 27,975.—JOSEPH F. EYLAR, of Scott, Ohio.—*Improvement in Cultivators*.—Patent dated April 24, 1860.—The plough frames are adapted to be raised to clear the shares from the ground, and admit of the implement being moved freely around by the following device: chains or ropes *d* are attached to the frames at *f*, and after passing over pulley M, connect to pulleys N on shaft *o*. A crank P is formed in this shaft, through which, by the feet of the drawer, the shaft may be rotated, and the frames hoisted so as to clear the ploughs of the ground.

Claim.—The described arrangement of the ploughs E F, frames G, links H, chains I, standards K, levers L, chains or cords *d*, pulleys M N, and crank shaft O P, constructed and operating in the manner and for the purposes set forth.

No. 27,976.—HENRY W. FARMER, of Poultney, Vt.—*Improved Window Blind Slat Machine*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the combination of the guide rods Q T U V W X adjusted on one side of the machine, and yielding or elastic on the other, constructed, arranged, and operating substantially as described, with the double sets of feed rollers *k k k k*, all situated in front of the first cutter head, for the purpose specified.

I also claim the adjustable cutter heads S S for perfecting the beaded edges of the shades, when arranged in combination with the guide rods Q T U V W X, and pressing block J, substantially as described, so as to receive the shades in proper position directly from the side dressing cutter heads, without intermediate manipulation or machinery, and to finish them with unerring accuracy in their continuous and direct course through the machine.

No. 27,977.—MYRON FOX, of Stanford, Conn.—*Improved Method of Insulating and Supporting Lightning Rods*.—Patent dated April 24, 1860.—This invention consists in making the insulator in two or more sections matched together around the rod or conductor, without disturbing any other insulator or supporter, and when in place, will mutually support each other in a proper position; and having, in combination with the above, a supporter or band, made in two or more parts, hinged together in such a manner as to allow of its being opened and placed around the insulator after the latter is placed upon the rod, and when screwed or otherwise fastened to the side of the building or other support, it binds together the insulator, and holds all firmly in place.

Claim.—The insulator formed in two or more sections D d E e matched together in combination with the hinged supporter A B C, or its equivalent, made to operate substantially as and for the purposes set forth.

No. 27,978.—SAMUEL M. FOX, of New York, N. Y.—*Improvement in Tracks for City Railroads*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the grooved and flat rails for city railroads, combined with the cylindrical and flanged wheels for the cars, in the manner and for the purpose set forth.

No. 27,979.—HENRY GIFFARD, of Paris, France.—*Improved Feed Water Apparatus for Steam Boilers*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the method of supplying vessels under pressure with any non-elastic fluid, by the direct action of steam or other gaseous fluid, also under pressure, when this fluid is brought in direct contact with and enters the aforesaid vessels along with the non-elastic fluid to which it has first given the necessary force to overcome the resistance, substantially as described.

Second. I claim the general construction, arrangement, and combination of apparatus for forcing water or other liquids, by the direct action of a jet or jets of steam, or other gaseous fluid, substantially as described.

No. 27,980.—ROBERT HAWKINS, of Bealsville, Penn.—*Improvement in Bee Hives*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The trap I, when constructed with a stationary grating *f*, and removable glass window *g* at its back, and arranged on a bee hive as and for the purpose described.

No. 27,981.—A. HOEN, of Baltimore, Md.—*Composition for Etching Stone*.—Patent dated April 24, 1860.—The claim explains the nature of this invention.

Claim.—The employment, as a mordant for lithographic stones, of a composition of gum arabic or its equivalents, with citric acid or some other acid forming a combination insoluble in water with the lime of the stone, substantially in the manner specified, so as to produce what is termed the "lithokaustic" method of etching stone.

No. 27,982.—RICHARD HORN BROOK, of Cincinnati, Ohio.—*Improvement in Running Gear for Railroad Cars*.—Patent dated April 24, 1860.—This invention relates to an arrangement of supplementary wheels, with broad flangeless tires, and adapted, when occasion requires it, to temporarily relieve the ordinary gear from its support of the car either on one or both sides.

Claim.—The supplementary axles C, and eccentric wheels D, arranged and combined with the running gear of a railroad car, substantially as and for the purpose set forth.

No. 27,983.—H. C. HUNT, of Ottumwa, Iowa.—*Improvement in Bench Planes*.—Patent dated April 24, 1860.—A protecting metallic strap *e*, whose turned up extremities are pivoted to the edges of the lower end of the front bit *a*, loosely embrace the lower end of the cutting

bit *b*, so that when the plane is shoved forward the strap *e* will swing freely upwards into a notch which is formed in the plane stock for its reception.

Claim.—Combining the metallic swinging strap *e* with the bits of said plane, substantially in the manner and for the purpose herein set forth.

No. 27,984.—JAMES IVES, of Mount Carmel, Conn.—*Improvement in Harness Pads.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: First, in the construction of a harness pad detached from the tree or housing, I *claim* the combination, with the perforated plate *A*, of a U-shaped washer plate *B*, which has rivets or hooks formed on it, and is arranged within the pad and below the perforated pad plate, substantially as and for the purpose set forth.

Second. Confining the back band loop in position by combining it with a detachable *T* bolt *F* of the pad plate *A*, substantially as and for the purposes set forth.

Third. Closing up and confining one end of the pad by the combined agency of the back band loop *G* and the *T* bolt *F*, substantially as and for the purposes set forth.

Fourth. Providing the cap *G*¹ with a band or loop *f*, and with lugs *d d*, and using it in combination with a tree *E*, which has shoulders *e e* formed substantially in the manner and for the purpose described.

No. 27,985.—JAMES JENKINSON, of Brooklyn, N. Y.—*Improvement in Ventilators for Hats.*—Patent dated April 24, 1860.—This invention consists in arranging in the inner side of the crown of a hat a series of wings or fans, attached to spring arms, which emanate from a perforated hub in such a manner that motion is imparted to said wings by the motion of the person wearing the hat.

Claim.—The combination, with the crown of the hat, of a ventilator *V*, constructed and operating substantially in the manner and for the purpose specified.

No. 27,986.—WILLIAM D. JONES, of Dayton, Ohio.—*Improved Method of Adjusting the Planes in Moulding Machines.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the shafts *A B* and *T* in their relation to each other and to the parts of the machine to which they are connected, the two first named shafts being susceptible of both vertical and lateral adjustment, as set forth.

No. 27,987.—L. B. JOYNER, of Hilliardston, N. C.—*Improvement in Cotton Thinning Ploughs.*—Patent dated April 24, 1860.—This invention consists in the arrangement of the shears, revolving cutters, frame, driving gear, and gear wheels.

Claim.—The arrangement of the shears *i h*, revolving cutters *g g*, frame *a*, driving wheel *b*, and gear wheel *d c*, substantially as and for the purpose set forth.

No. 27,988.—SELIGMAN KAKELES, of New York, N. Y.—*Improvement in Fluid Lenses.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application and use of a magnet, or its equivalent, in the bottom of a glass globe filled with a colored fluid, for the purpose as set forth.

No. 27,989.—A. KANE and N. KANE, of Newport, N. Y.—*Improvement in Harvesters.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventors say: We *claim* so combining a lever, that extends from the conductor's seat, with a ratchet and pawl, by means of a hinged arm *m*, or its equivalent, as that the driver or conductor, from his seat, may throw said pawl out of action with said ratchet, entirely, and when the machine is in motion or otherwise, and yet admit of said pawl slipping over the ratchet when in gear with it, and when the machine is backed, substantially as described.

We also claim, in combination with the shoe plate *P* and shoe *U*, the latter of which is secured to the finger bar and the former to the braces *Q* and *R*, the set screws *p p*, one on each side of the hinge joint, for the purpose of making a rigid connection between the finger bar and the shoe, when the machine is to be converted into a reaper, substantially as set forth.

We also claim making the track clearer of a harvesting machine in two sections, when the same are hinged together in such a manner that they act like a stiff track clearer when the machine is moved forward, but that the lower section may swing on the hinges and yield when the machine is backed, substantially in the manner described.

No. 27,990.—ISRAEL W. KNOX, of San Francisco, Cal.—*Improvement in Amalgamators.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the grinder D, constructed and fitted within the pan B, to operate as and for the purpose set forth.

Second. The conical projection C provided with a discharge opening *a* and gate *b*, and having a central position within the pan B, to serve as a hub for the grinder D, substantially as shown and described.

Third. The employment or use of the frame J fitted within the pan B and covered with amalgamated plates, and used with or without the lining of amalgamated plates for the pan, substantially as and for the purpose set forth.

Fourth. The combination of the pan B with its conical projection C and gate *b*, the grinder D, and frame J, covered with the amalgamated plates, substantially as and for the purpose specified.

No. 27,991.—GEORGE KOCH and A. STOECKEL, of New York, N. Y.—*Improvement in Veneer Cutting Machines*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment or use of the slotted bar I, being directly in front of the knife in the way, substantially as shown, so as to perform the double function of a weight for the bolt and a hot water conductor.

No. 27,992.—ADOLPHUS LIPPMAN, of New York, N. Y.—*Improved Fire Escape*.—Patent dated April 24, 1860.—This invention consists in arranging in the centre of an extension ladder, a covered passage in such a manner that persons from a building which may be on fire can be assisted to and can pass down through said passage; and also in combining with said passage a platform on the top, and a sliding carriage, with a windlass, in such a manner that when the ladders are extended and the carriage is raised, the platform enables persons to step into the carriage from a window or any other place.

The inventor says: I *claim*, first, arranging in the centre of the extension ladders D D¹, a covered passage G, substantially as and for the purpose described.

Second. The combination, with the covered passage G, of the platform J, and the sliding carriage H, constructed and operating substantially as and for the purpose specified.

Third. The arrangement of the inclined posts or standards C, in combination with the frame F, of the ladders D, and with the windlass E, constructed and operating substantially in the manner and for the purpose set forth.

No. 27,993.—JOHN S. LLOYD, of Salem, N. J.—*Improvement in Buckets for Removing Coal, &c.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The application and use of a slide on the bottoms of self-adjusting buckets, as well as its particular construction and arrangement in connection with the spring S, by means of which the bucket is made to open and close itself.

No. 27,994.—JOHN S. LLOYD, of Salem, N. J.—*Improvement in Machines for Hoisting Hay, &c.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The construction, combination, and arrangement of the fork, bucket, cords, levers, pulleys, springs, and railway, the arms E E to the block D, and the mode of attaching and supporting the railway to the barn or frame, so as to allow the wheels B B, with the attached blocks and fork, or bucket, to pass freely along the whole length of the rail.

No. 27,995.—MICHAEL MASSEY, of Cleveland, Ohio.—*Improvement in the Construction of Candle Machines*.—Patent dated April 24, 1860.—This invention consists in providing the machine with split pipes, each half being dovetailed at the top and bottom ends into the inside edge of two inner frames that slide in grooves in the outer frame, each half pipe having flanges grooved and tenoned, so that when closed they form a perfect joint.

The inventor says: I *claim* the combination and operation of the several devices, namely: the split pipe P, the right and left screw S, the springs in the sliding frames A, the knife K, the receiving boards H, and the drum G, as described and operating, for the purpose set forth.

No. 27,996.—LEVI MATTHEWS, of Antrim, Ohio.—*Improvement in Pumps*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment of a reciprocating cap board, disk, or vane, immersed in the water of the well and operating conjointly with the plunger, in combination with a stationary receiving valve, or valves, to the pump, arranged to face said cap board, or thereabouts, and so that the cap board plays to and fro said valve or valves, substantially in the manner and for the purposes specified.

No. 27,997.—GREGOR MENZEL, of Milwaukee, Wis.—*Improvement in Fire Proof Safes.*—Patent dated April 24, 1860.—This invention consists in the peculiar construction of fire and burglar proof safes. It is constructed in a cylindrical shape, with a convex top and bottom P, thus securing great strength, and by making the interior E to revolve upon a pivot L, bringing a smooth impenetrable surface of iron entirely across the outer opening with a visible inlet or seam.

The inventor says: I *claim*, first, the revolving book stand E, and the outer cylinder B, there being an air space X between the book stand and cylinder E, and between the two cylinders B and E, and the parts named, by being constructed and arranged as set forth.

Second. I claim the convex top and bottom P P, of the outer cylinder, in combination with the projections U thereon, for the purposes described.

No. 27,998.—WILLIAM HARRISON MCCOY, of Wheeling, and JOHN F. MUTH, of Grafton, Va.—*Improvement in Window Sashes.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The employment, in combination with a sash formed of divided lights, or numerous panes, of separately detachable pane holding frames C C, constructed and applied to fit the sash, essentially as specified, for the purpose of retaining the glasses in their places and to admit of the easy and speedy separate removal thereof; also forming a readily transportable means for measuring or sizing the panes, substantially as shown and described.

No. 27,999.—JAMES S. MCCURDY, of Brooklyn, N. Y.—*Improvement in Stitch Made by a Sewing Machine.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The stitch produced with a single thread, by passing two loops thereof successively through the same perforation in the fabric to be sewed, passing the second of such loops through the first one, and passing through the second one the first of two similar loops that are passed in the same manner through the next perforation, substantially as described and represented by the accompanying drawings.

No. 28,000.—MATTHEW C. McCULLERS, of Herndon, Ga.—*Improvement in Ploughs.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The arrangement of the handles, beam, and brace, and their several connecting parts, so as to make a plough stock that will admit of the changes, or receive the ploughs or mould boards, as stated, and in the manner set forth.

No. 28,001.—SAMUEL MAXWELL, of Baltimore, Md.—*Improved Composition for Removing Gum from Machinery.*—Patent dated April 24, 1860.—The inventor says: The composition is as follows: For a cask of 30 gallons take 30 pounds of quick lime, 1 pound of calcined magnesia, 1 pound of flour of sulphur, 1 pound of powdered French chalk, $\frac{1}{4}$ pound of harts-horn, (carbonate of ammonia,) and $\frac{1}{2}$ pound of chloride of lime. Put these materials in a 30-gallon barrel and add about 15 gallons of water, let it stand about 24 hours, being well stirred during that time, then add 8 gallons of whale oil and seven gallons of melted tar or other fat; mix it well and it is ready for use.

Claim.—The composition of ingredients and the process of admixture thereof, substantially as set forth and for the purposes specified, of removing gummy matter from machinery, &c.

No. 28,002.—AARON H. MILLER, of La Porte, Ind.—*Improvement in the Construction of Rotary Evaporators.*—Patent dated April 24, 1860.—A is the evaporator, divided into compartments 1 and 2 by a strip a; in the centre of A is a vertical bearing, or journal box b, through which passes the spindle c: around this the evaporator revolves; d d d are rollers attached to the furnace and serve to lessen the friction caused by the moving of the evaporator; B and B¹ are faucets for drawing off the boiled juice from the compartments 1 and 2 of the evaporator; C is the heating apparatus; D the rake or stirrer.

Claim.—The rotary evaporator A, with the compartments 1 and 2, constructed and operating substantially as set forth.

No. 28,003.—JAMES MONTGOMERY, of Baltimore, Md.—*Improved Combined Salinometer and Water Gauge for Steam Boilers.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a hollow float F, having a hollow arm e, which communicates with the atmosphere, when said float and arm are so arranged that any water which may leak or insinuate itself into the float will automatically, or by its own gravity, flow out or discharge therefrom, substantially as set forth.

Second. The combination of window c, and indicating arm g, when so arranged that the

visible level of the water will act to show the height of the same, substantially as and for the purposes set forth.

Third. The hydrometer scale *h*, attached to the end of the indicating arm *g*, and arranged at the side of the window *c*, so that the amount of saturation of the water with salt or other mineral may be easily read without the aid of a meter, substantially as set forth.

Fourth. Making the axial box or bearing of the float arm with an alarm passage *m*, in combination with the providing of a similar passage in the flanch *e* of the hollow arm, when the joint between the hollow arm and its axial box is made tight by the internal pressure of the steam of the boiler, substantially as set forth.

No. 28,004.—JAMES MONTGOMERY, of Baltimore, Md.—*Improvement in Railroad Car Axles*.—Patent dated April 24, 1860.—The edges of the bar *A*, at the cylindrical parts, are parallel, so as to enable them to be brought flush with each other at these parts and held firmly together by steel thimbles or sleeves *B*, having corrugations on their inner peripheries and placed in proper positions on the cylindrical portions while in a heated state, and cooling and shrinking thereon so as to firmly hold said parts together.

The inventor says: I *claim*, first, a shaft, or axle, constructed substantially as described.

Second. In combination with the same a central brace, or braces *D*, movable journal *B*, and cast iron hub, constructed substantially as set forth.

Third. The openings *E* between the circumferences of the axle and the thimble journal *B*, and through the body of the metal composing the journal box, substantially as and for the purposes set forth.

No. 28,005.—C. P. MORTON, of Philadelphia, Pa.—*Improvement in Saw Mills*.—Patent dated April 24, 1860.—This invention consists in the general arrangement, in relation to each other and to the saw, of two sets of double tracks upon track rails in front and rear of the saw, and a friction roller to serve both as a support and centre of motion to the timber near the teeth of the saw.

Claim.—The arrangement of the trucks *A A*¹ and *A*² and *A*³, respectively with each other and with the track rails *C C* and rollers *h*, in relation to the saw *d*, as set forth, the same operating together in the manner and for the purpose described.

No. 28,006.—DAVID R. NELSON, of Jackson, Ohio.—*Improved Machine for Adding Numbers*.—Patent dated April 24, 1860.—This invention consists in a provision of finger keys numbered from 1 to 9 inclusive, each, when depressed, being made through a peculiar arrangement of mechanism to act upon and move forward the finger of a dial the exact number of units carried on the face of the key itself, so that when a column of figures has been added by depressing the keys corresponding to the figures of the column the amount may be read on the face of the dial.

Claim.—The combination of the keys *B*, adjustable brackets *g h*, hinged lever *F*, and pawl *G*, operating through ratchet wheel *D* on the index *c*, substantially in the manner and for the purpose explained.

No. 28,007.—SEPTIMUS NORRIS, of Philadelphia, Pa.—*Improvement in Guide Wheels for Locomotives*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, the application of two radial bars jointed to the frame of the guide wheels and working with four centres.

Second. I *claim* the compound curved block in connection with the roller, for supporting and guiding the wheels through curves, at the same time holding them rigid in a straight line of rail.

No. 28,008.—ELFANES M. NOYES, of Newark, N. J.—*Improvement in Combs*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—As an improved article of manufacture, a comb which is provided with a back piece *Q*, in the manner described, the said back piece being made of a single piece of horn bent across the grain, so that the grain of the horn shall cross the back of the comb, substantially as set forth.

No. 28,009.—JAMES PEELER, of Tallahassee, Fla.—*Improvement in Seeding Ploughs*.—Patent dated April 24, 1860.—*A* is the beam of the plough, *C* and *D* two metallic bars, which are bolted to the beam at *a* and *d* at their upper ends; said bars cross each other, and are bolted together at *X*. The bar *D* is turned at its lower end and forms a land side; said bar not only serves as a land side, but also as a brace. The lower end of the bar *C* extends forward and is made tapering so that the blades may be secured upon it.

Claim.—The general arrangement of the bars *C* and *D*, as constructed, the catch *c*, blade

H, clevis L, beam A, upright K, handles I, hopper J, and wheels B and B¹, the whole being used for the purpose of forming a seeding plough, substantially as set forth.

No. 28,010.—WORDEN P. PENN, of Belleville, Ill.—*Improvement in Rakes for Harvesters*.—Patent dated April 24, 1860.—When the machine is in operation the rod D causes the lever F to vibrate upon a horizontal plane, while at the same time the eccentric groove causes it to vibrate upon a vertical plane, and the horizontal movement of the lever causes the rake B to move to and fro across the platform c¹, and the vertical movement of the lever causes the shaft P to lift the rake off of the platform upon its backward motion, so as to clear the grain or straw that it may not heap it up or push it off of the outside of the platform.

Claim.—The levers F and O rigidly connected together and loosely pivoted together at e, in combination with the crank H, connecting rod D, shaft P, and guide rods b b, grooved shoe I, and platform C, the whole constructed and arranged substantially as described.

No. 28,011.—GEORGE W. RAINS, of Newburgh, N. Y.—*Improved Feed Water Apparatus for Steam Boilers*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, the combination of the cylinder A connected with the boiler, as described, the piston D having a hollow rod, the valve F having an attached rod passing through the piston and its hollow rod, the rotating disk I, furnished with a pin f and projecting ring, the griper G H, or its equivalent, and the rod L suspended from the piston rod; the whole applied in connection with the cock N in the suction pipe, or its equivalent, to operate substantially as described.

And in combination with the above specified apparatus, I claim the alarm cock V, applied in connection with the rod L, to operate substantially as set forth.

No. 28,012.—ROBERT RAMSDEN, of South Easton, Pa.—*Improvement in Pumps*.—Patent dated April 24, 1860.—This invention consists in constructing that class of pumps called "plunger pumps," in such a manner that they will discharge water either when the plunger or piston is raised up or pushed down, without using more valves than are required by that class of pumps which only discharge water on the down stroke of the plunger.

Claim.—The combination of the plunger E, constructed as described, with the chambers B and C, the stuffing boxes a a a a and d d d d, and the valves f and g, substantially in the manner described and for the purposes set forth.

No. 28,013.—GEORGE RUGG, of Potsdam, N. Y.—*Improved Bullet Ladle*.—Patent dated April 24, 1860.—This invention consists in providing the bottom of the blade with an aperture, which aperture is to be closed by the end of the lever, and which aperture by means of the lever can be opened or closed at pleasure.

Claim.—The construction of the ladle with an aperture A, and the lever B to close the aperture at A, and to operate substantially as described.

No. 28,014.—WILLIAM B. SCAIFE, of Pittsburgh, Pa.—*Improved Metallic Cask*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A cask, barrel, or keg made of sheet iron, having its sides corrugated longitudinally, in the manner described, to produce a bilge and leave the parts near the heads plain and united with the heads by lap joints which extend beyond the heads in the form of a chime, as described.

No. 28,015.—L. K. SELDEN, of Haddam, Conn.—*Improved Portable Swing*.—Patent dated April 24, 1860.—The object of this invention is to construct a cheap swing and standards for supporting it, with flexible base pieces for keeping the parts erect, in such a manner that the whole may be folded up in a compact compass when not in use.

Claim.—The combination of slotted base pieces A A, extension pointed rods C C and C¹ C¹, braces D D, with cross bar G, and elastic swinging bars b b¹, with basket J, all arranged substantially in the manner and for the purpose set forth.

No. 28,016.—IRULUS R. SMITH, of Elgin, Ill.—*Improvement in Cultivators*.—Patent dated April 24, 1860.—This invention consists in the arrangement of the parts. A represents four shovel ploughs, and A¹ one shovel plough in front. The shovel plough A¹ and the guard pieces E are made movable.

Claim.—The combination of the long standards A A¹, the check or guard pieces E, the movable handles N, the saddle P for the beam B to roll upon, the truss G, consisting of the pieces of iron S, the standards G G, the rod Y¹, the stretcher Y, the iron brace K, and the joint H, attached to the two wheeled carriage O, as described, and for the purpose specified.

No. 28,017.—WILLIAM SOMERVILLE, of New York, N. Y.—*Improved Device to Prevent Horses from Interfering*.—Patent dated April 24, 1860.—This invention consists in cementing a pad of India rubber or other similar substance into a recess made for the purpose in the hoof of the horse, and in a proper position to prevent contusions.

Claim.—Providing the foot of a horse with a pad, inserted and attached substantially as described and for the purpose set forth.

No. 28,018.—OTIS W. STANFORD, of Cincinnati, Ohio.—*Improvement in Horse Powers*.—Patent dated April 24, 1860.—This invention is an arrangement of mechanism for enabling a horse power employing a cogged driving wheel, axle beam, and a separate tumbling or pinion shaft, receiving motion from the periphery of said driving wheel, to operate with ease and effect upon uneven ground.

Claim.—The combination of the rotary platform C, axle beam D, cogged driving wheel E F, pinion shaft N P, hinge c, and slotted socket M m, constructed, arranged, and operated in the manner and for the purposes explained.

No. 28,019.—CALVIN STOWE, of Braceville, Ohio.—*Improvement in Corn Shock Binders*.—Patent dated April 24, 1860.—A represents the spindle or shaft, B the crank, C the sliding handle, D the rope, E the hook, *fff* knots on the rope.

Claim.—The sliding handle C, hook E, and knots *fff*, as described, for the purpose specified.

No. 28,020.—GEORGE C. TAFT, of Worcester, Mass.—*Improvement in Letter Copying Presses*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* casting the platen D and tubular piece E in one piece and at a time, in combination with forming the screw *a* by coring, as and for the purposes set forth.

I also claim the combination of a single platen piece D E and screw *a* with screw F, arch piece C, shoulders *c d*, and socket *b*, all arranged and operating in relation to each other, as and for the purposes set forth.

No. 28,021.—GEORGE W. TOLHURST, of Liverpool, Ohio.—*Improved Washing Machine*.—Patent dated April 24, 1860.—This invention consists in providing the shaft of a semi-circular rubber with cords, chains, or wires, placed in a position inside the rubber so as to cause a side motion when said rubber is made to oscillate.

Claim.—The cords H H, in combination with the shaft D and rubber C, the whole being combined and arranged for the purposes set forth and specified.

No. 28,022.—RICHARD TEN EYCK, JR, of Brooklyn, N. Y.—*Improved Machine for Enamelling Mouldings*.—Patent dated April 24, 1860.—This invention consists in the use of reciprocating brushes, scrapers, pressure plates or hoods, (the latter being both stationary and movable,) and feed rollers.

The inventor says: I *claim* the employment or use of plates or hoods L N, in connection with scrapers M K, arranged to operate substantially as and for the purpose set forth.

I also claim, in combination with the scrapers M K and plates or hoods L N, the brushes J, for the purpose specified.

No. 28,023.—THOMAS P. TROTT, of Washington, D. C.—*Improved Labels for Mail Bags, &c.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* a label plate, so fastened by one or both of its ends to a mail or other bag, package, or other thing, as that, whilst it is permanently attached thereto, it may nevertheless be turned thereon, substantially as described, when said plate is furnished with a shield, panel, or raised fillet, flange, or projection, as set forth.

And I claim, in combination with such a label plate that is permanently attached to the bag, package, or box, and is furnished with such a shield or panel, the attachable and removable labels, such as herein described and represented.

No. 28,024.—JAMES UNDERKOFER, of Philadelphia, Pa.—*Improvement in Hand Trucks*.—Patent dated April 24, 1860.—This invention consists in combining certain hooked rods and angular pieces with a truck, so that the whole may form a combined sack holder and truck for facilitating the removal of grain and other materials.

Claim.—Combining the movable hooked rods H, and the angular pieces G with the frame of the truck, substantially in the manner and for the purpose set forth.

No. 28,025.—AUGUSTUS C. VANDYKE, of Greensburg, Ky.—*Improved Apparatus for Heating Ore*.—Patent dated April 24, 1860.—This improvement consists in a peculiar arrangement of the heating grate, conical open work, valve and feed doors, in connection with the tunnel head of an iron furnace.

Claim.—Arrangement of the open work grate or basket E, conical open work grate F, rod G, lever H, and doors D and D¹, in connection with the tunnel head A, the whole being constructed, combined, and operated in the manner and for the purposes set forth.

No. 28,026.—JAMES A. VAUGHN, of Cuyahoga Falls, N. Y.—*Improvement in Grain Separators*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—Arranging the grain board T, screen U, and cockle board Z so as to incline in the direction of the length of the machine, while the series of zigzag screens and their boards incline towards the sides of the machine, as described, so that while the chaff is delivered at one end of the machine, the cockle and the screenings shall be delivered at the opposite end thereof, as described.

No. 28,027.—JOHN WAUGH, of Elmira, N. Y.—*Improved Machine for Cutting Sheet Metal*. Patent dated April 24, 1860.—In using this machine to cut circular plates or sheets, the clamp head is connected with the shears head by inserting its base rail *f* into the groove K; the sheet to be cut being adjusted between the clamp plates by the eye, or by the gauge rod *g*, and clamped by means of the screw *e*. The clamp head is then brought up properly to the shears, and fixed in this position by the lever *i*, or by the set screw *q*, or by both, and the sheet rotated against the shears with one hand, while the winch *q* is turned by the other.

The inventor says: I *claim*, first, the sheet head Fig. 2, composed of the table E, with its tongued rails *v*, and pieces 5, carrying the perforated lugs 6, the gauge rods *r*, the clamp 2, with its springs 4, and the gauge plate *t u*, when constructed and arranged as described.

Second. The combination of the rotary clamp head Fig. 3, and of the said sheet head connected with its carriage D, Fig. 1, severally with the groove K, and rotary shears head B, when they are arranged as described.

No. 28,028.—ROBERT T. WILDE, of New York, N. Y.—*Improvement in the Manufacture of Bonnet Frames*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—In the construction of bonnet frames, the peculiar method of arranging and uniting the front head and stay wires, as set forth, by means of which the manufacture of bonnet frames is not only facilitated, but an uniformity in the stiffness and thickness of the front wire is thereby secured.

No. 28,029.—THOMAS WINDELL, of New Albany, Ia., assignor to himself and GEORGE R. CANNON, of the same place.—*Improvement in Tombstones*.—Patent dated April 24, 1860.—This invention consists in making tombstones and monuments of glass, in which inscriptions may be pressed.

Claim.—Manufacturing tombstones, or monuments of glass, in which inscriptions may be pressed, substantially as and for the purpose specified.

No. 28,030.—WILLIAM E. WORTHEN, of New York, N. Y.—*Improvement in Metallic Sash*. Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—The combination of metallic bars with bent pieces of sheet metal, constituting shoulders against which panes of glass may rest, and with sheet metal bases, when the whole are joined each to the other, substantially in the manner set forth, and constituting a metallic sash, substantially such as is described.

No. 28,031.—GEORGE H. WOOD, of Green Bay, Wis.—*Improvement in Machines for Crushing Stone*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

The inventor says: I *claim* the solid shaft D D¹ *d*, on two axes meeting at a point below the roller E, and slightly separated from each other above said roller. I claim also the construction of the roller E, in the shape of two truncated cones, and the mode of combining, adjusting, and operating the same with the shaft D D¹ *d*.

I claim also the combination and arrangement of the shaft D D¹ *d*, and the crushing roller E, with the crushing box B, when used and operated, substantially as specified, for the purpose of crushing, without grinding, stone, quartz, or any other material which can be crushed or pulverized by pressure.

No. 28,032.—BENJAMIN H. WRIGHT, of Rome, N. Y.—*Improved Steam Boiler*.—Patent dated April 24, 1860.—This invention consists of a cylindrical shell *a a a* enclosing another cylinder *b b b*, between which is a water space; in the lower part of the hollow or cavity of the inner cylinder is to be fitted a suitable grate and ash pit. Proper charging apertures to be provided with suitable doors are to be cut through both cylinders and around the apertures, the inner and outer shells are to be connected so as to prevent the escape of water in any unusual or improper manner.

Claim.—The arrangement described for promoting the centripetal movement of the water, and the durability of the horizontal water tubes, by cutting off the direct communication between the steam chamber and end of the tubes nearest the feed pipe.

No. 28,033.—G. W. BLAKE, of Pepperell, Mass., assignor to himself and L. W. BLAKE, of said Pepperell.—*Improved Belt Fastening*.—Patent dated April 24, 1860.—This invention consists in the employment of two-eyed loops or links, which are passed through suitable slits cut at certain distances into the ends of the belt, in combination with rods which pass through the several eyes on both ends, and extending across the whole width of the belt, so as to fasten the two ends together without creating any elevation, or bulging out of the belt.

Claim.—The employment of two-eyed loops or links *B*, in combination with the rods *C*, substantially as and for the purpose described.

No. 28,034.—CHARLES BRANWHITE, of Williamsburgh, N. Y., assignor to CHARLES KNOX, of New York, N. Y.—*Improved Hat Rack for Cigars, &c.*—Patent dated April 24, 1860.—This invention consists in applying to the inside of a hat a rack for holding cigars, &c., constructed of reed, whalebone, or similar material, to which are applied strips of India rubber, attached to the hoops at suitable intervals by metal clasps, forming loops which, on account of their elastic properties, will receive and hold cigars, &c.

Claim.—The described cigar rack for hats, constructed and applied in the manner substantially as described.

No. 28,035.—W. I. CANTELO, of Philadelphia, Pa., assignor to STUART & PETERSON, of said Philadelphia.—*Improvement in Stoves*.—Patent dated April 24, 1860.—This invention consists of a box, or chamber, to which both air and gas are freely admitted, in combination with a cap, the latter having curved or inclined ridges provided with slits, so that the external air may have a free access to the lower part of the flame produced by the ignited gas as the latter passes through the slits.

Claim.—The combination of the chamber and cap, the latter having inclined or curved ridges provided with slits, in the manner and for the purpose specified.

No. 28,036.—THEODORE R. DUNHAM, of Newark, N. J., assignor to THOMAS B. PEDDIE and JOHN MORRISON, of said Newark.—*Improvement in Travelling Bags*.—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.

Claim.—A travelling bag having its interior provided with springs or elastic strips that are capable of being turned, as shown and described, so as to distend or not distend the sides of the bag as desired, all as set forth.

No. 28,037.—THOMAS GEORGE HAROLD, of Brooklyn, N. Y., assignor to himself and JAMES H. HAROLD, of said Brooklyn.—*Improved Needle Case*.—Patent dated April 24, 1860. The claim and engravings explain the nature of this invention.

The inventor says: I *claim*, first, a needle case having a turning cover, or its equivalent, with an opening for the delivery of a needle, or needles, from one of the receptacles of said case, substantially as specified.

Second. And in combination with said case and turning cover, I claim the ratchet *e*, and indicating numbers around such case, for the purposes set forth.

No. 28,038.—HENRY A. JONES, of St. Louis, Mo., assignor to E. H. DEWEY, of said St. Louis.—*Improved Machine for Finishing Wooden Boxes*.—Patent dated April 24, 1860.—The object of this invention is to smooth off the surfaces of boxes, and cut off the projecting ends of the boards at the corners of the box, so that after it has passed through the machine for doing this it will be finished and ready for the market.

The inventor says: I *claim*, first, the endless travelling apron *B*, with clamping jaws *a a a a*, arranged and operating as set forth with relation to the rotary saw and cutter head *D D¹ E*, the whole operating in the manner and for the purpose specified.

Second. The adjustable guide plate *G*, carrying chamfering cutters *I c*, and smoothing cutter *H*, as shown and described.

Third. The bevelled chamfering cutters *g g*, arranged with relation to the travelling apron *B*, and guide plate *G*, as set forth and for the purpose described.

No. 28,039.—FREDERICK KAVEMANN, CHARLES KAVEMANN, and BANNERT HOERSTSMANN, of Cincinnati, Ohio.—*Improvement in Extension Ladders*.—Patent dated April 24, 1860.—F is a jack by which one section after another may be elevated, the claws *f* being applied to a round of the section to be raised, the jack resting upon the ground.

Claim.—The described combination of the disconnected jack *F f*, with the sliding and detachable sections 1, 2, 3, 4, 5, clips *A*, hooks *B*, stops *C*, brace *D*, and rack *E*, the whole being constructed and arranged and operated in the manner and for the purpose set forth.

No. 28,040.—FREDERICK C. MEYER, of Philadelphia, Pa., assignor to E. MEYER, of said Philadelphia.—*Machine for Copying Figures, &c.*—Patent dated April 24, 1860.—The claim and engravings explain the nature of this invention.
